

Downscaled Earth System Model Data for Resilient Energy System Planning

Grant Buster
ESIG Forecasting and Markets Workshop
June 2025

Meteorology and Grid Reliability

- Up to 83% of major reported power-outages in the U.S. from 2000-2021 can be attributed to weather-related events
- Major outages have been increasing over the analysis time period

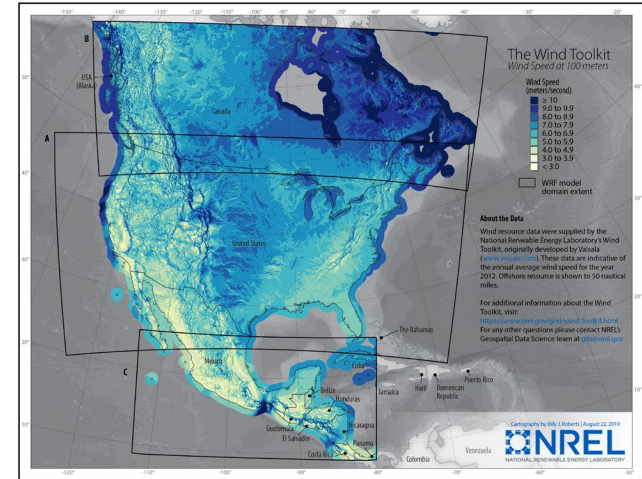

Integration of Earth System Data: Mind the Gap

Earth System Models (ESMs)

<https://www.gfdl.noaa.gov/visualizations-climate-prediction/>

Mesoscale NREL Datasets (WTK, NSRDB)

~100 km grid resolution
daily average data
2000-2100

How do we bridge this gap?

~2-4 km grid resolution
5 min-hourly data
Historical

Generative Adversarial Networks (GANs) for Downscaled Earth System Model (ESM) Data

True High Res (WTK or NSRDB)

4km Hourly

Coarsen to
create
training data

Low Res (WTK, NSRDB, ESM)

100km Daily

Discriminative
Model

Generative
Model

Synthetic High-Res Output

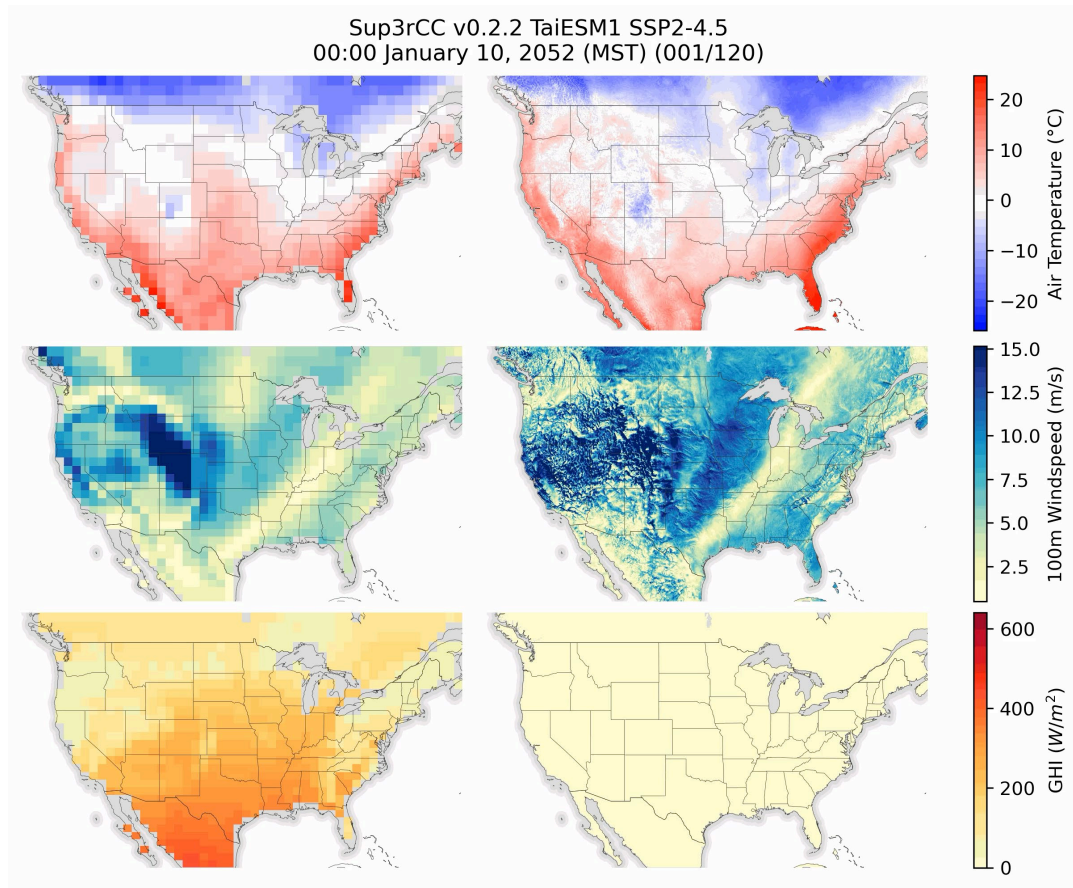

4km Hourly

Benefits of Downscaling with ML:

1. Computational efficiency (up to 280x faster than WRF)
2. Designed for renewables (wind, solar, temp, humidity)
3. Fully integrated into energy analysis software
4. Open-source: <https://nrel.github.io/sup3r/>

Sup3rCC

- The Sup3rCC 4km hourly outputs (right) add **high-resolution spatial features** and **temporal dynamics** conditioned on the low-res ESM input (left)
- Data availability:
 - v0.1.0 EC-Earth3 (SSP5-8.5, 2015-2059)*
 - v0.1.0 MRI-ESM-2.0 (SSP5-8.5, 2015-2059)*
 - v0.2.2 MRI-ESM-2.0 (SSP5-8.5, 2000-2059)
 - v0.2.2 TaiESM1 (SSP2-4.5, 2000-2099)
 - v0.2.2 GFDL-CM4 (SSP2-4.5, 2000-2059)
 - v0.2.2 MPI-ESM1.2-HR (SSP2-4.5, 2000-2059)
 - v0.2.2 EC-Earth3-CC (SSP2-4.5, 2000-2059)
 - v0.2.2 EC-Earth3-Veg (SSP2-4.5, 2000-2059)
- Data available on NREL-HPC and OEDI:
 - `/datasets/sup3rcc/`
 - [DOI 10.25984/1970814](https://doi.org/10.25984/1970814)

Buster et al., “High-resolution meteorology with climate change impacts from global climate model data using generative machine learning”, *Nature Energy* (2024).
<https://doi.org/10.1038/s41560-024-01507-9>

*v0.2.2 data is strongly recommended over v0.1.0

What's new in v0.2.2?

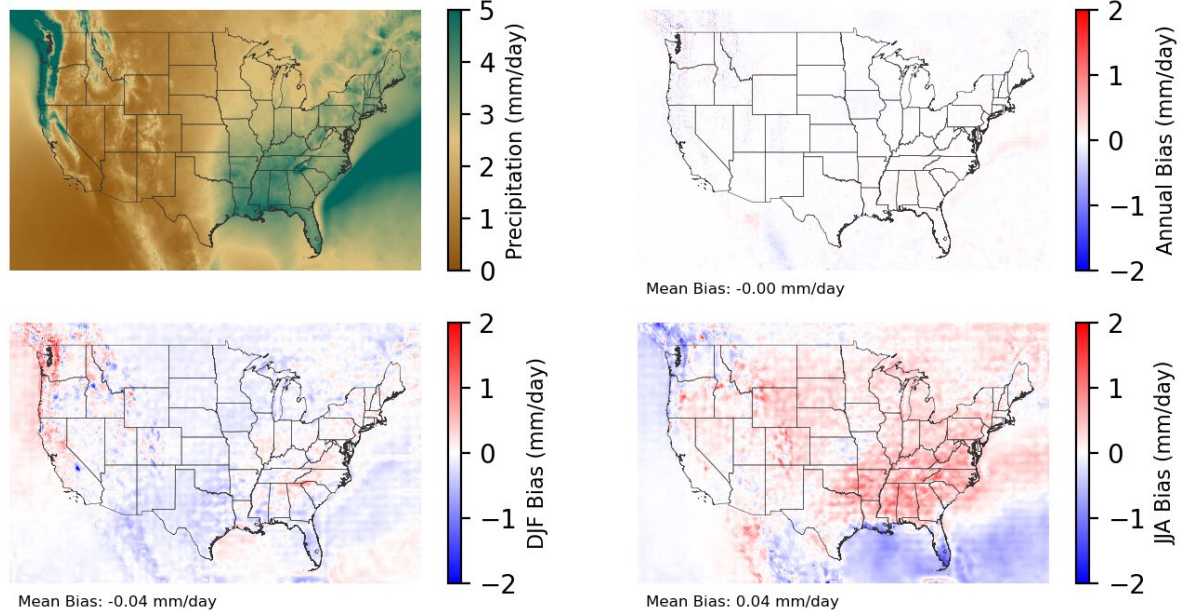

Sup3rCC v0.2.2 Improvements

1. Precipitation

- New 4km daily precipitation data
- Based on Daymet 4km precipitation data
- Being validated in ORNL hydrological models

2. Double Bias Correction

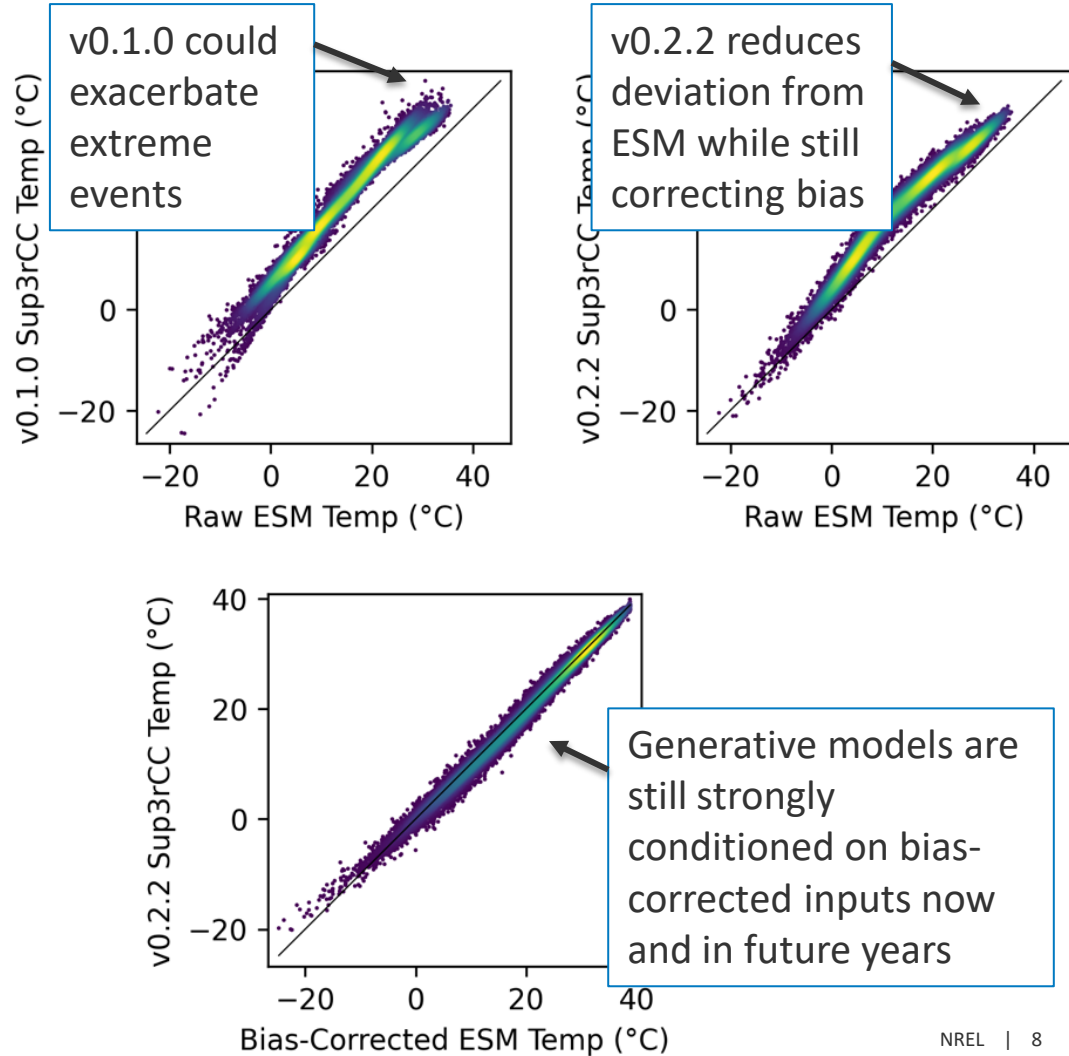

3. Generative Model Improvements

Multiyear mean and bias maps for precipitation for v0.2.2 Sup3rCC-TaiESM1 over the overlapping historical years 1980–2019. Bias is calculated as Sup3rCC minus data from Daymet. Top left panel is Sup3rCC mean values; top right is mean annual bias vs. Daymet; bottom left is mean bias for December, January, and February (DJF); bottom right is mean bias for June, July, and August (JJA).

Sup3rCC v0.2.2 Improvements

1. Precipitation
2. **Double Bias Correction**
 - Previous bias correction was not trend-preserving
 - New method (Quantile Delta Mapping) is trend-preserving and handles each quantile explicitly
 - Minimal bias in new data vs. historical datasets over 1980-2019
3. Generative Model Improvements

Sup3rCC v0.2.2 Improvements

1. Precipitation
2. Double Bias Correction
3. **Generative Model Improvements**
 - Improved computational efficiency: 7x faster than the original work and 283x faster than the original WRF estimate
 - Annual hourly timeseries for 1e6 grid cells in 24 node hours on NREL HPC
 - Enabled us to downscale more ESMs to better quantify uncertainty

Sup3rCC
EC-Earth3-CC
SSP2-4.5

Sup3rCC
EC-Earth3-Veg
SSP2-4.5

Sup3rCC

SSP2-4.5

Sup3rCC
MPI-ESM1-2-HR
SSP2-4.5

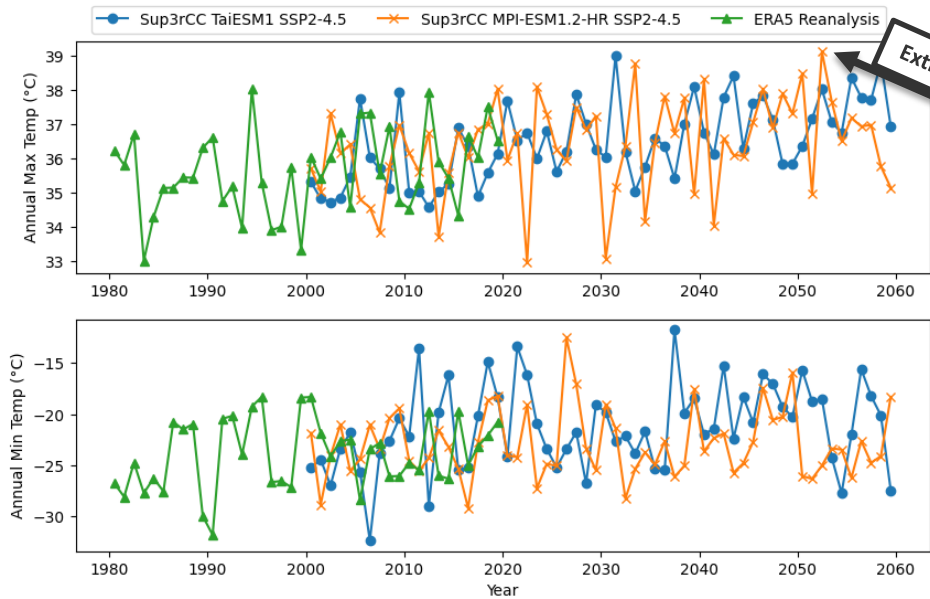

Sup3rCC
TaiESM1
SSP2-4.5

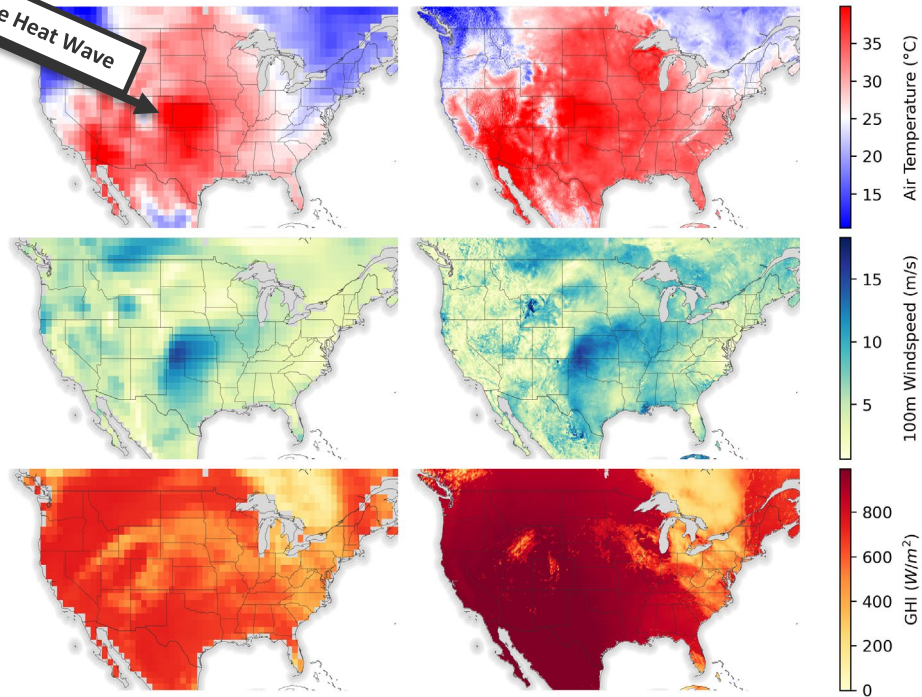

Maps of dry-bulb temperature changes in temperature through midcentury (2040–2059 minus 2000–2019) for v0.2.2 Sup3rCC SSP2-4.5 scenarios. The change maps include stippling where four or more of the downscaled data products are in agreement on the sign of change.

Extreme Events in Denver, CO

Extreme Heat Wave

Sup3rCC v0.2.2 MPI-ESM1.2-HR SSP2-4.5
12:00 July 10, 2052 (MST) (085/120)

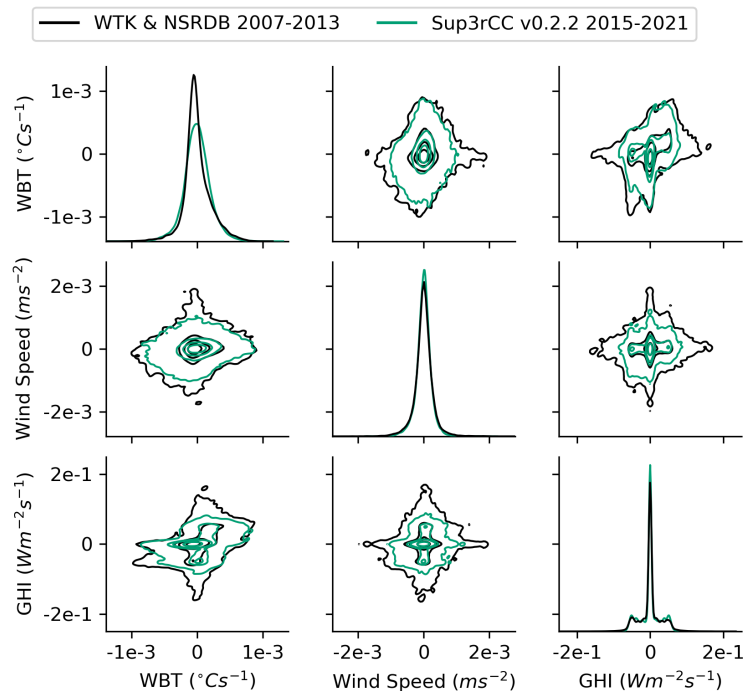

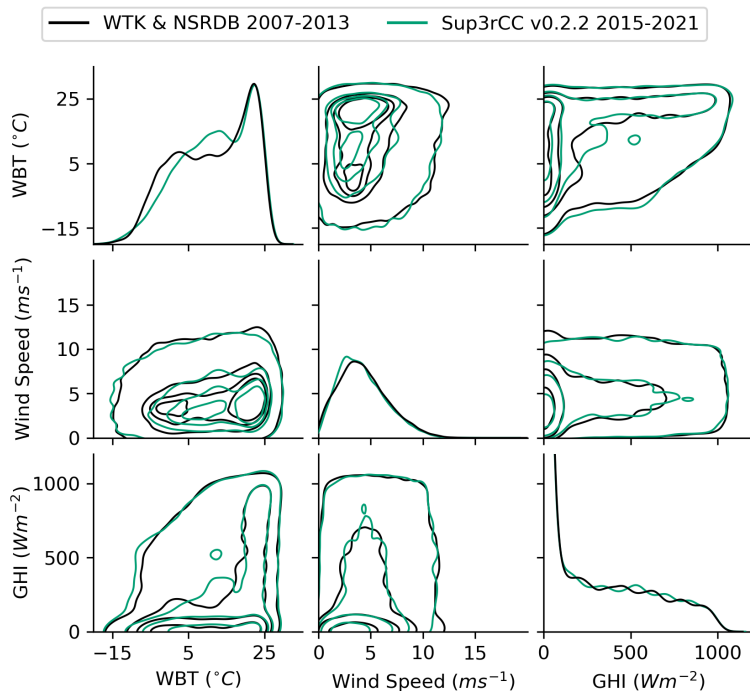

Sup3rCC can be used to study the impact of unprecedented heat waves and cold snaps but **cannot be used to study historical events**

Validation?

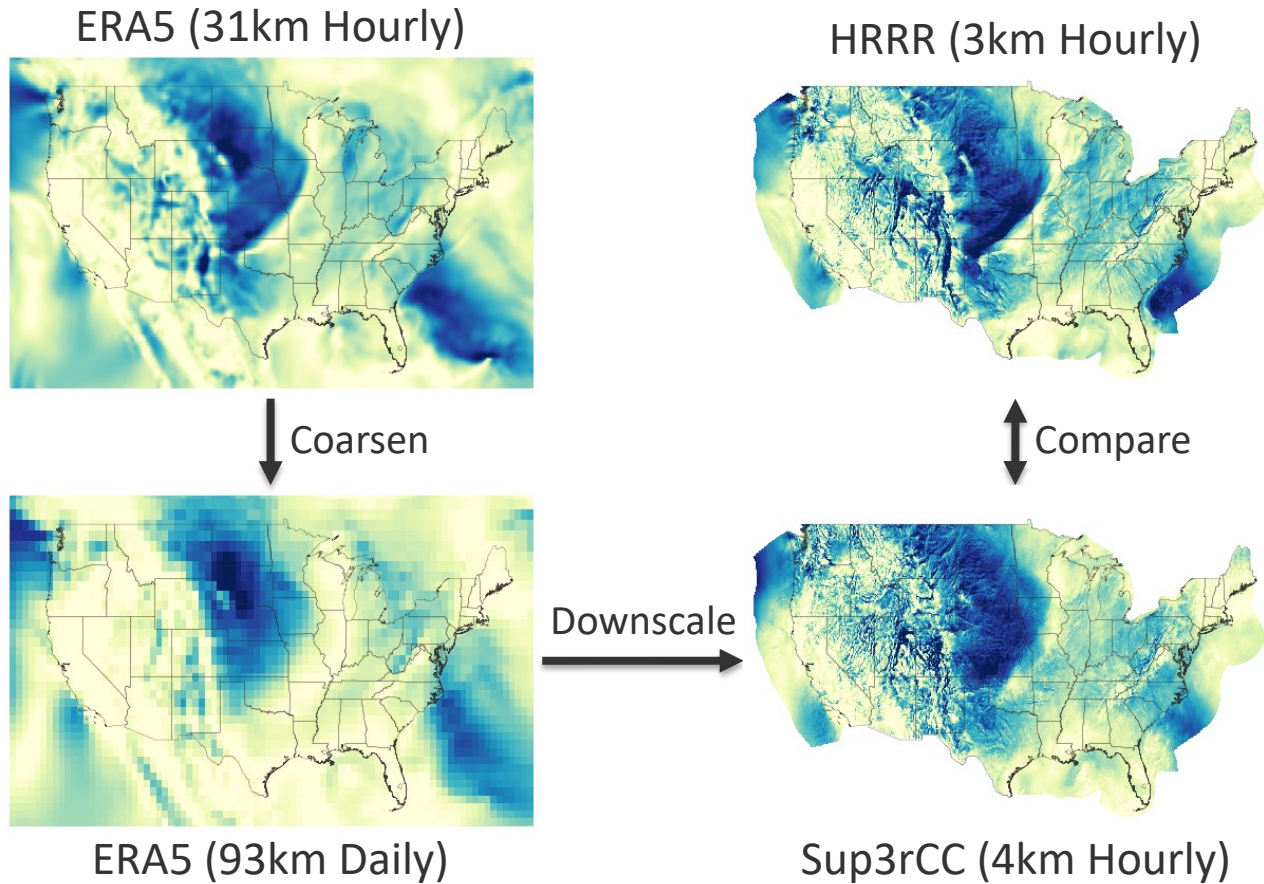

Validation: Statistical

- Sup3rCC reproduces joint distributions between correlated weather variables (left) including their time derivatives (right)

Validation: Perfect Model

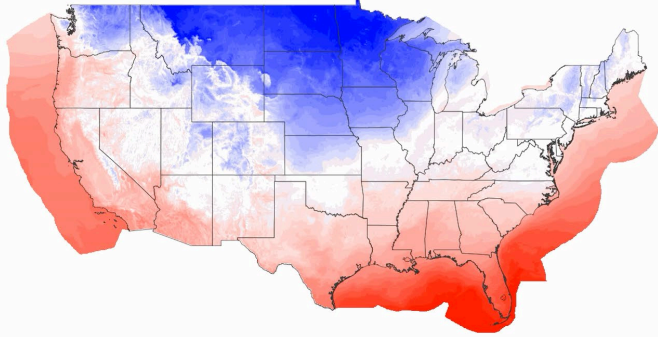

- Coarsened 93km ERA5 is treated as surrogate for ESM
- 93km ERA5 data is bias corrected and downscaled with pretrained Sup3rCC v0.2.2 models
- 4km Sup3rCC outputs compared against “ground truth” HRRR data

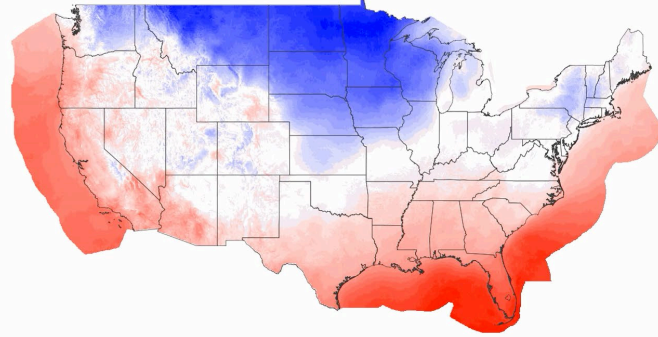

Validation: Perfect Model (2022 Winter Storm)

2022-12-21 00:00 (CST)

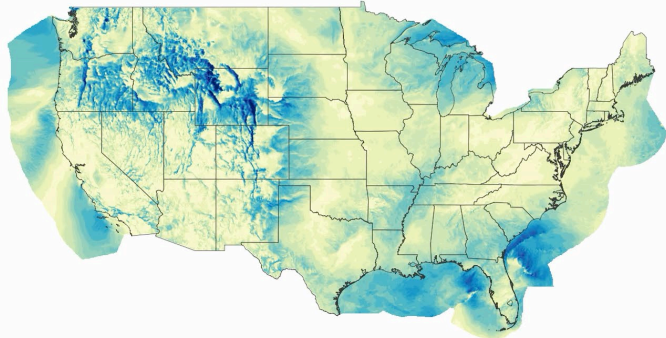

HRRR

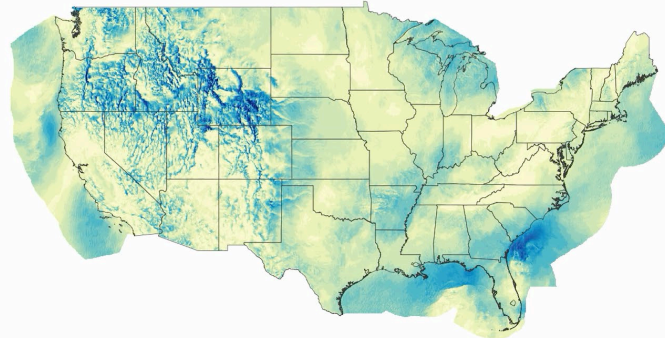

Sup3rCC

HRRR

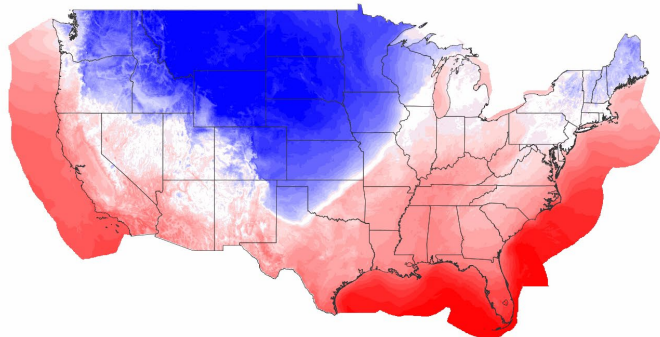

Sup3rCC

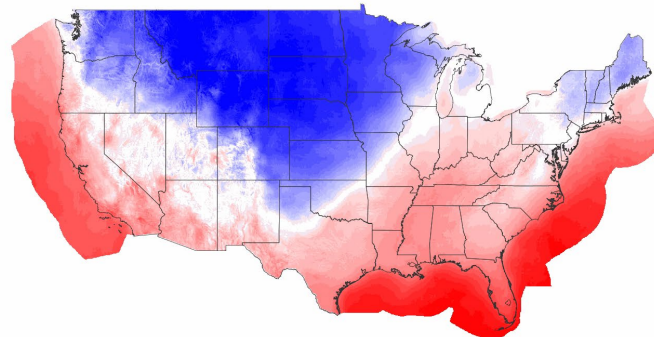

Validation: Perfect Model (2022 Winter Storm)

2022-12-22 04:00 (CST)

HRRR

Sup3rCC

HRRR

Sup3rCC

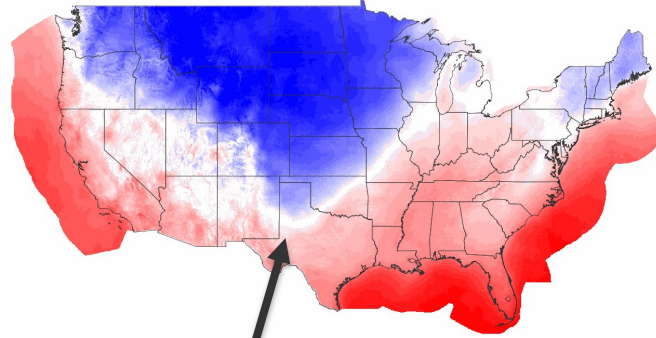

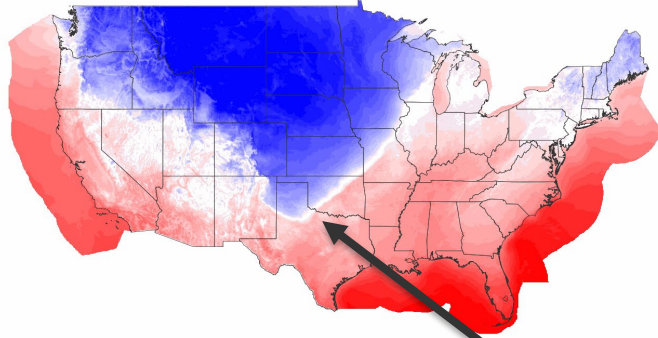

Validation: Perfect Model (2022 Winter Storm)

2022-12-22 04:00 (CST)

HRRR

Sup3rCC

Similar spatial structure and temporal progression. Slightly less sharp gradients in Sup3rCC vs. HRRR.

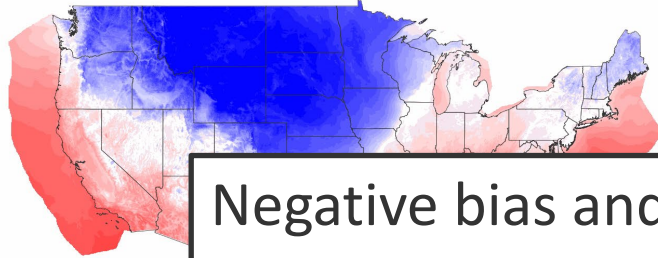

Validation: Perfect Model (2022 Winter Storm)

2022-12-22 04:00 (CST)

HRRR

Sup3rCC

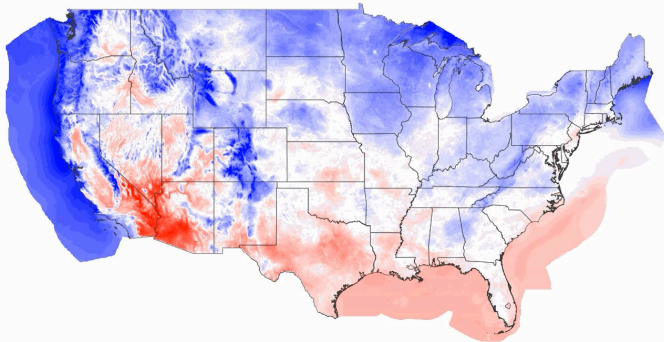

Negative bias and weak gradient in Sup3rCC wind front, likely due to residual bias in 93km ERA5 inputs vs. HRRR.

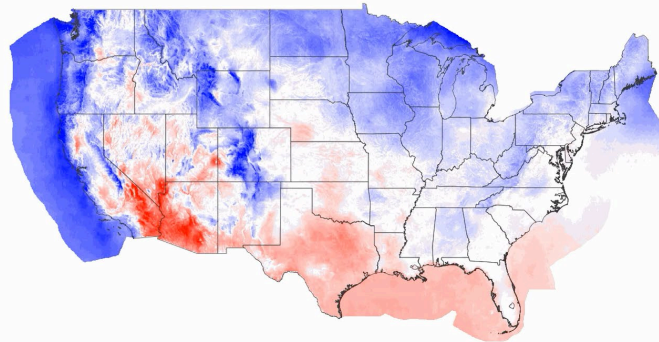

Validation: Perfect Model (2022 Heat Wave)

2022-07-22 00:00 (CST)

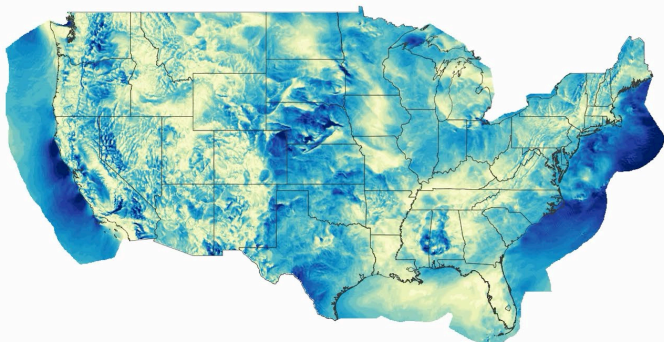

HRRR

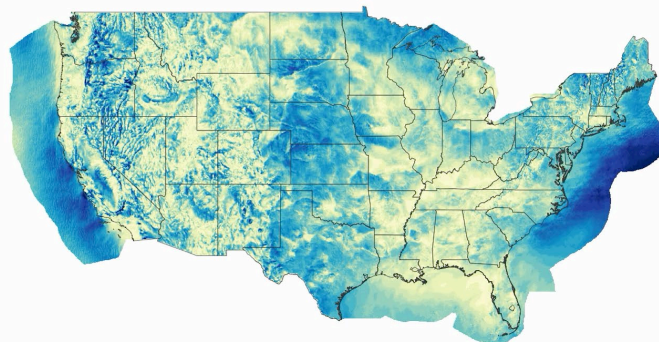

Sup3rCC

HRRR

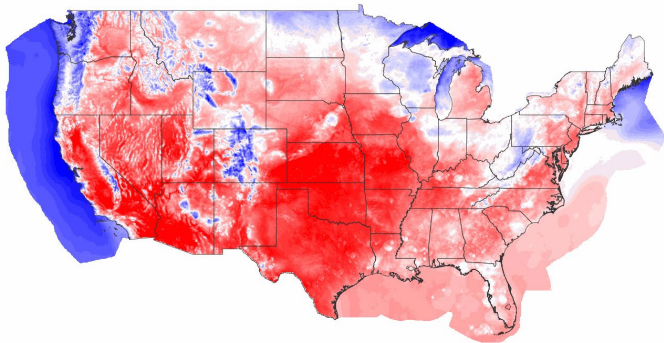

Sup3rCC

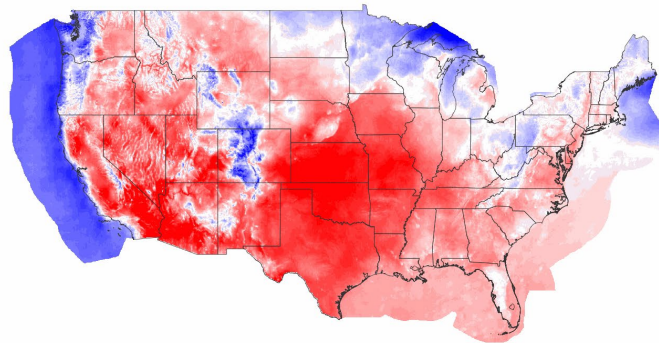

Validation: Perfect Model (2022 Heat Wave)

2022-07-23 19:00 (CST)

HRRR

Sup3rCC

HRRR

Sup3rCC

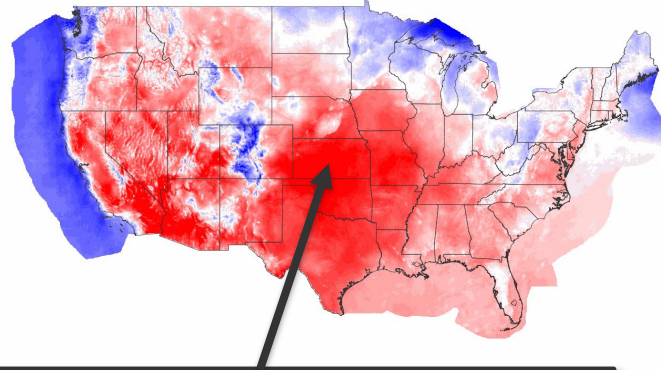

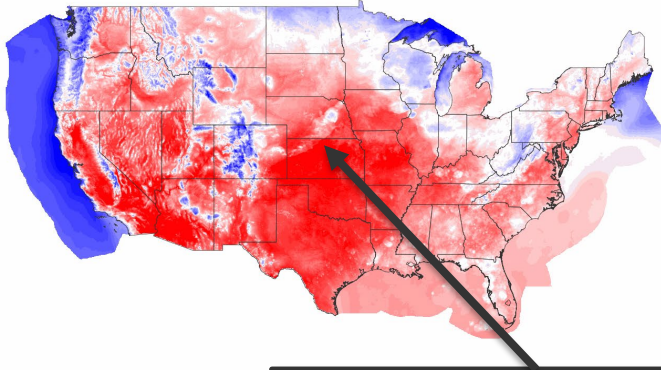

Validation: Perfect Model (2022 Heat Wave)

2022-07-23 19:00 (CST)

HRRR

Sup3rCC

Similar heatwave magnitude and terrain features; realistic but not historically accurate convective features.

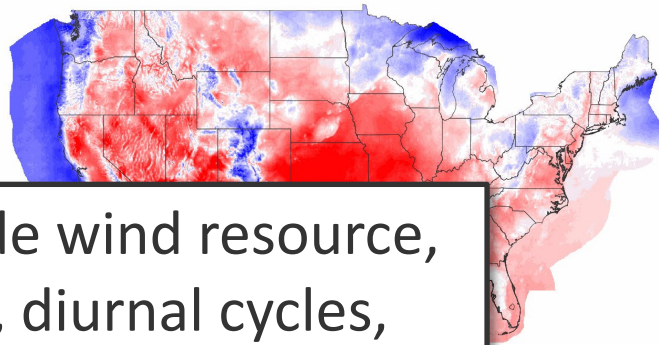

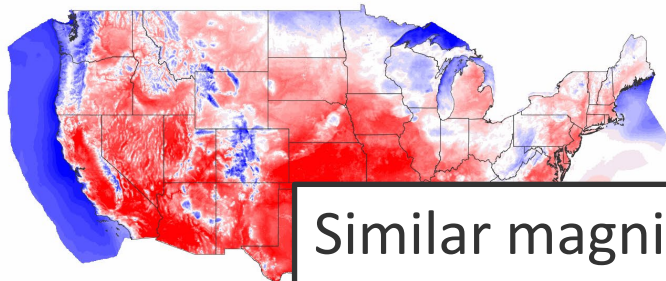

Validation: Perfect Model (2022 Heat Wave)

2022-07-23 19:00 (CST)

HRRR

Sup3rCC

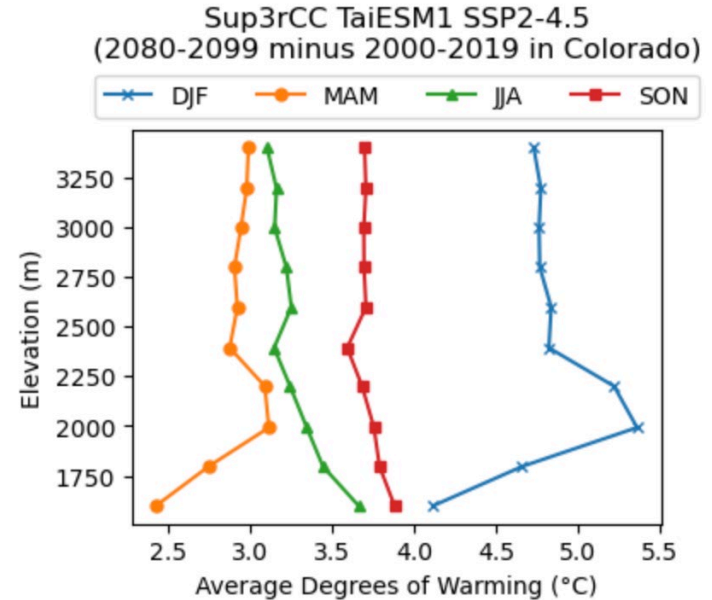

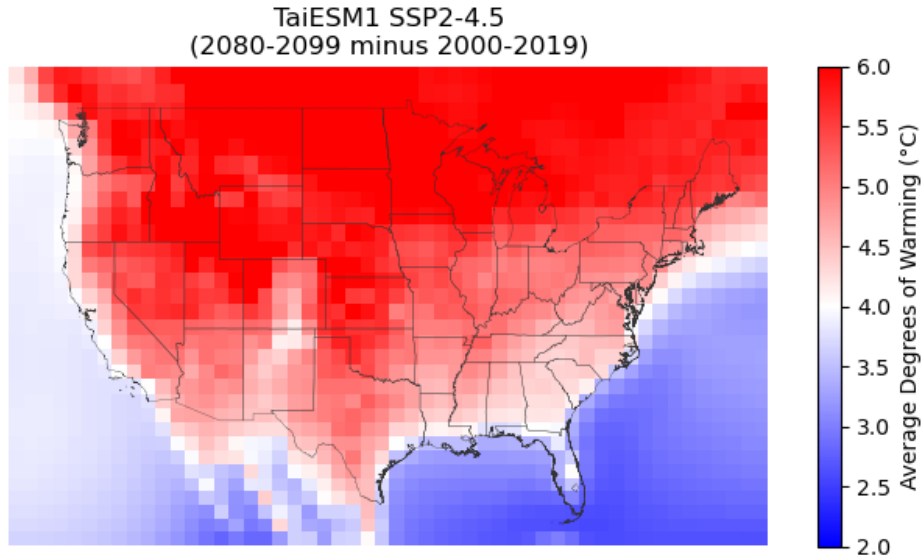

Similar magnitude wind resource,
spatial structure, diurnal cycles,
but different convective features.

Validation: Elevation-Dependent Warming

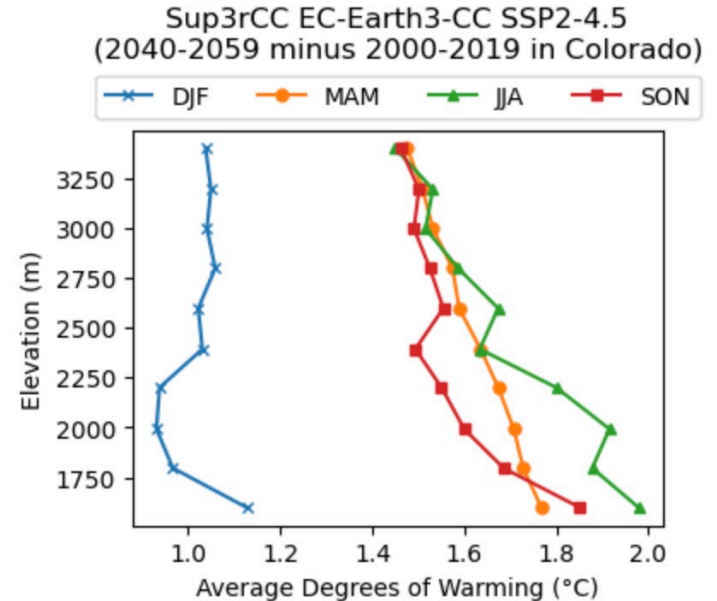

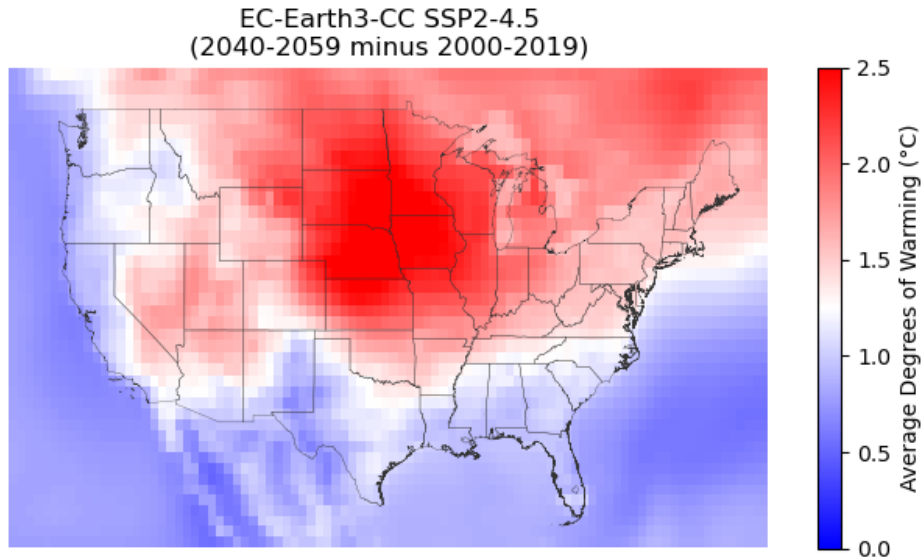

- Research by [Minder et al. 2018](#) has suggested the Rockies will experience elevation-dependent warming due to snow-albedo feedback

- 100km ESM estimate of warming strongly dictates Sup3rCC outputs
- 4km Sup3rCC *can* reproduce elevation-dependent warming signals in Colorado

Validation: Elevation-Dependent Warming

- Research by [Minder et al. 2018](#) has suggested the Rockies will experience elevation-dependent warming due to snow-albedo feedback

- Sup3rCC strongly preserves spatial trends in ESM warming signals, sometimes in contradiction of the trends found by Minder et al.

So how are we using this data
in power system analysis?

Energy System Planning for Resilience during Severe Weather (ESPRS)

- Downscaling future weather projections for power system analysis with multiple methods
 - Generative Machine Learning (Sup3rCC)
 - Numerical Weather Prediction (WRF)
- Exploration of planning strategies under meteorological uncertainty
 - Decision making with deep uncertainty (DMDU)
 - Stochastic capacity expansion
- Application to utilities
 - Tennessee Valley Authority
 - Southern Company

Decision Making Under Deep Uncertainty (DMDU) for Power System Planning

- Deep uncertainty occurs when there are multiple plausible futures, where we **cannot assign a probability distribution or characterize their likelihood**, and we **lack confidence in modelling the system** outcomes under these plausible futures
- Robust decision making (RDM) is one DMDU method used to evaluate **which decisions are robust to multiple possible futures** by stress testing these options against the possible futures

Each ESM has many weather years; each infrastructure plan results from a set of decisions and one ESM

We Are Exploring Meteorological, Economic, and Policy Uncertainties on Long Term Power System Planning

We answer the question:

Which pathways are robust and resilient amidst future uncertainties?

Uncertainties Considered

Climate

- Different ESMs – meteorology trajectory
- Unseen weather years

Economic and Policy

- RE siting scenarios
- Fuel prices
- Technology costs
- Transmission scenarios

Outcome metrics

- Resource adequacy (LOLE) } PRAS
 - Generation cost
 - Stranded asset cost
 - Unserved energy
 - Emissions
- } Zonal PCM or Simple dispatch

DMDU Analysis Plan

We plan to execute the DMDU activity in the following stages:

1. Capacity Expansion modeling for all CONUS regions
 - *Multiple infrastructure portfolios based on different weather scenarios*
2. Resource adequacy stress tests for all CONUS regions
 - *Explore meteorological sensitivities and robust infrastructure plans*
3. Zonal PCM or simple dispatch for a specific ISO/RTO
 - *Explore uncertainties with coarse zonal resolution*
4. Nodal PCM for a utility partner footprint
 - *Explore uncertainties at higher spatial resolution*
