

# Forecasting for an Integrated Energy System

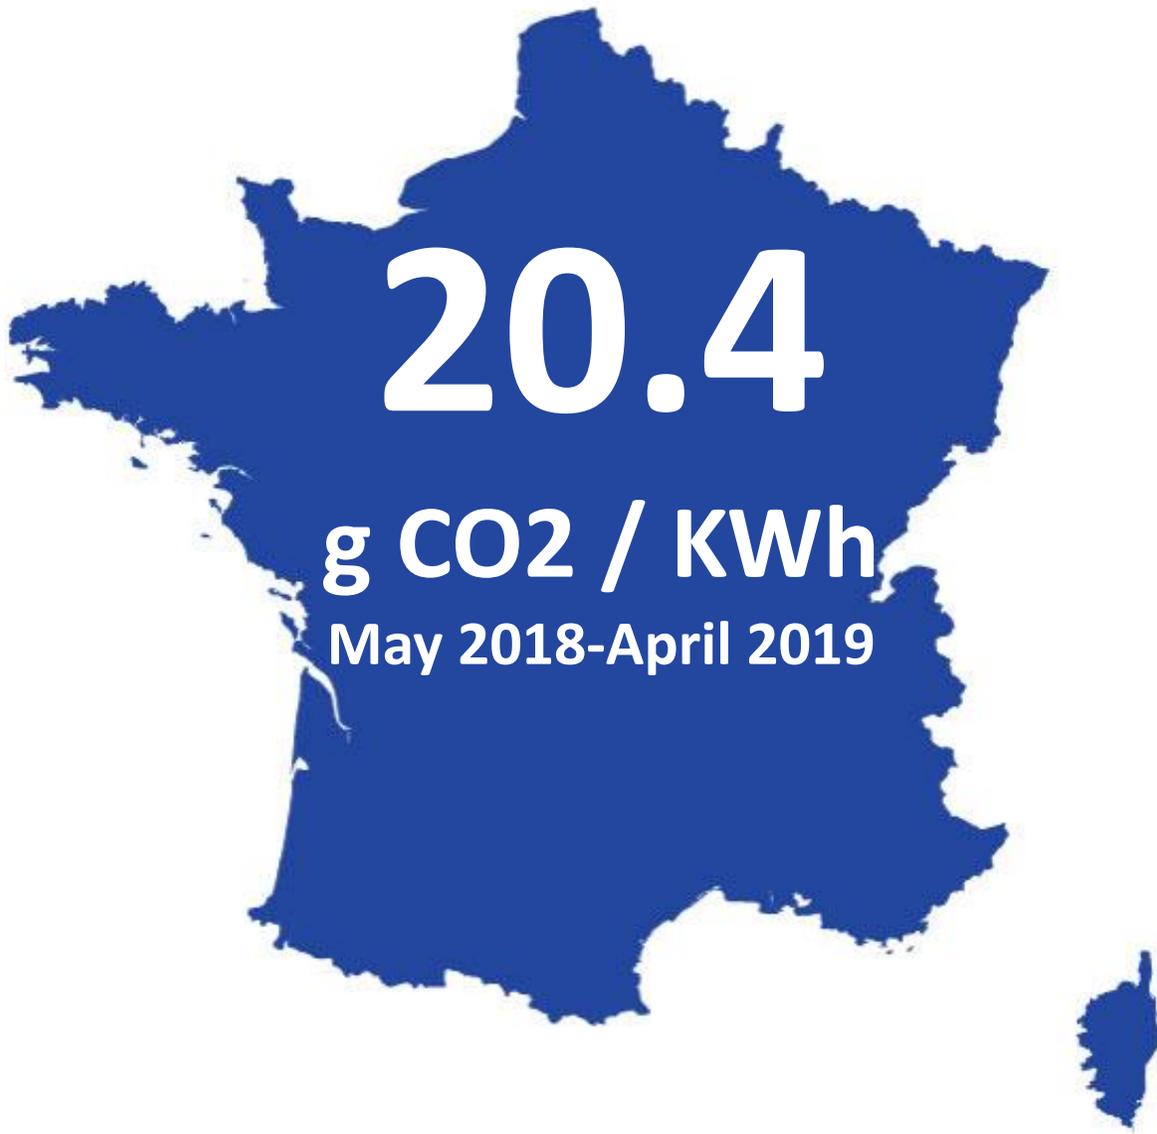

**Laurent Dubus**

With contributions from Stéphanie Dubost, Christophe Chaussin, Bénédicte Jourdir, Thierry Jouhannique, Bruno Charbonnier, Paul Le-Guen, Sylvie Parey, Paul-Antoine Michelangeli and many others

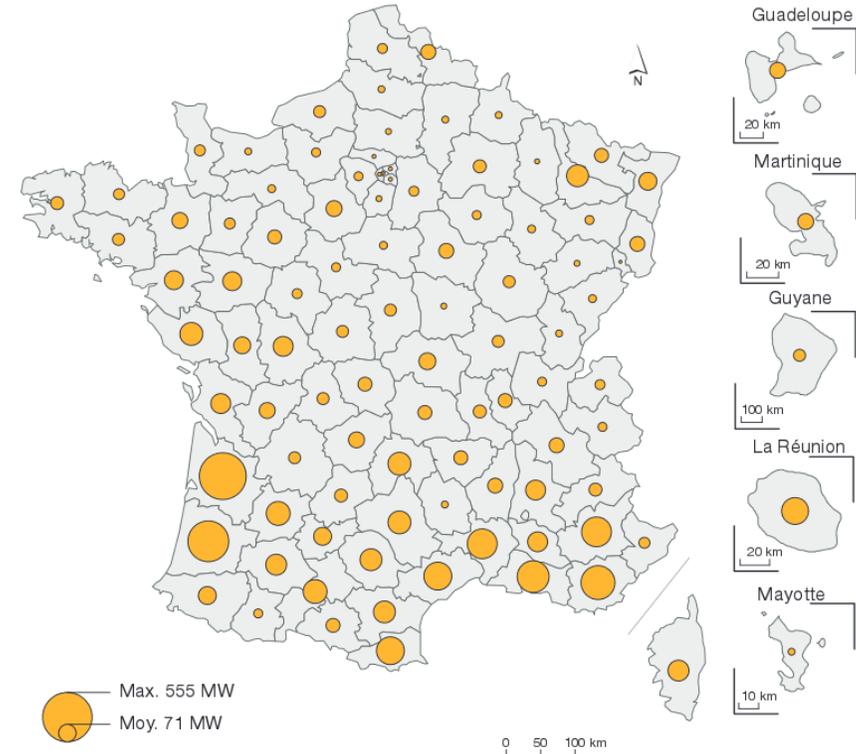

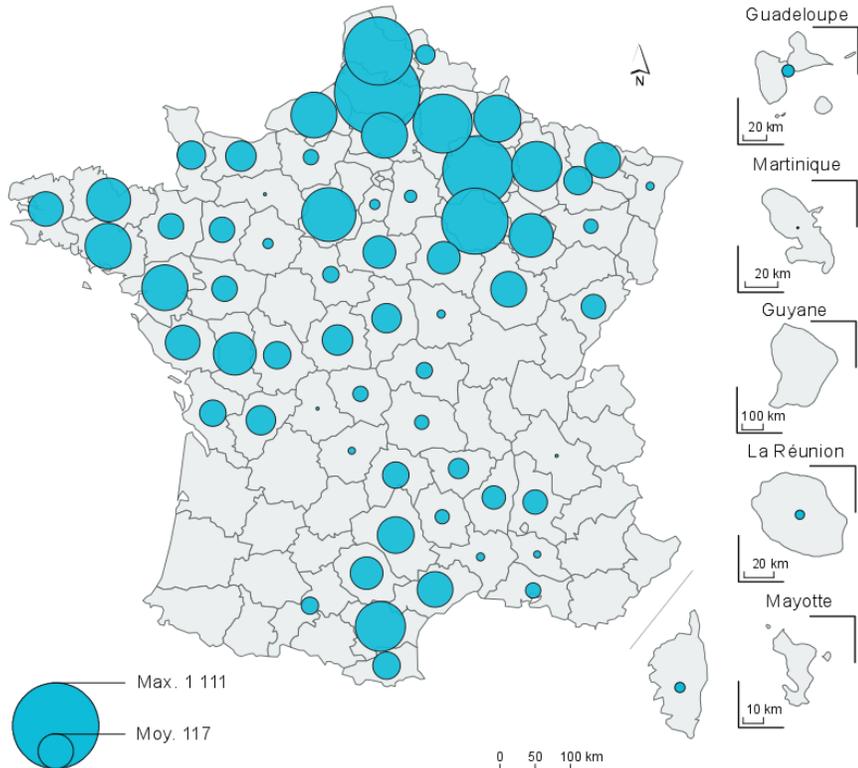

ESIG Meteorology & Market Design for Grid Services Workshop

6 June 2019, Denver, CO

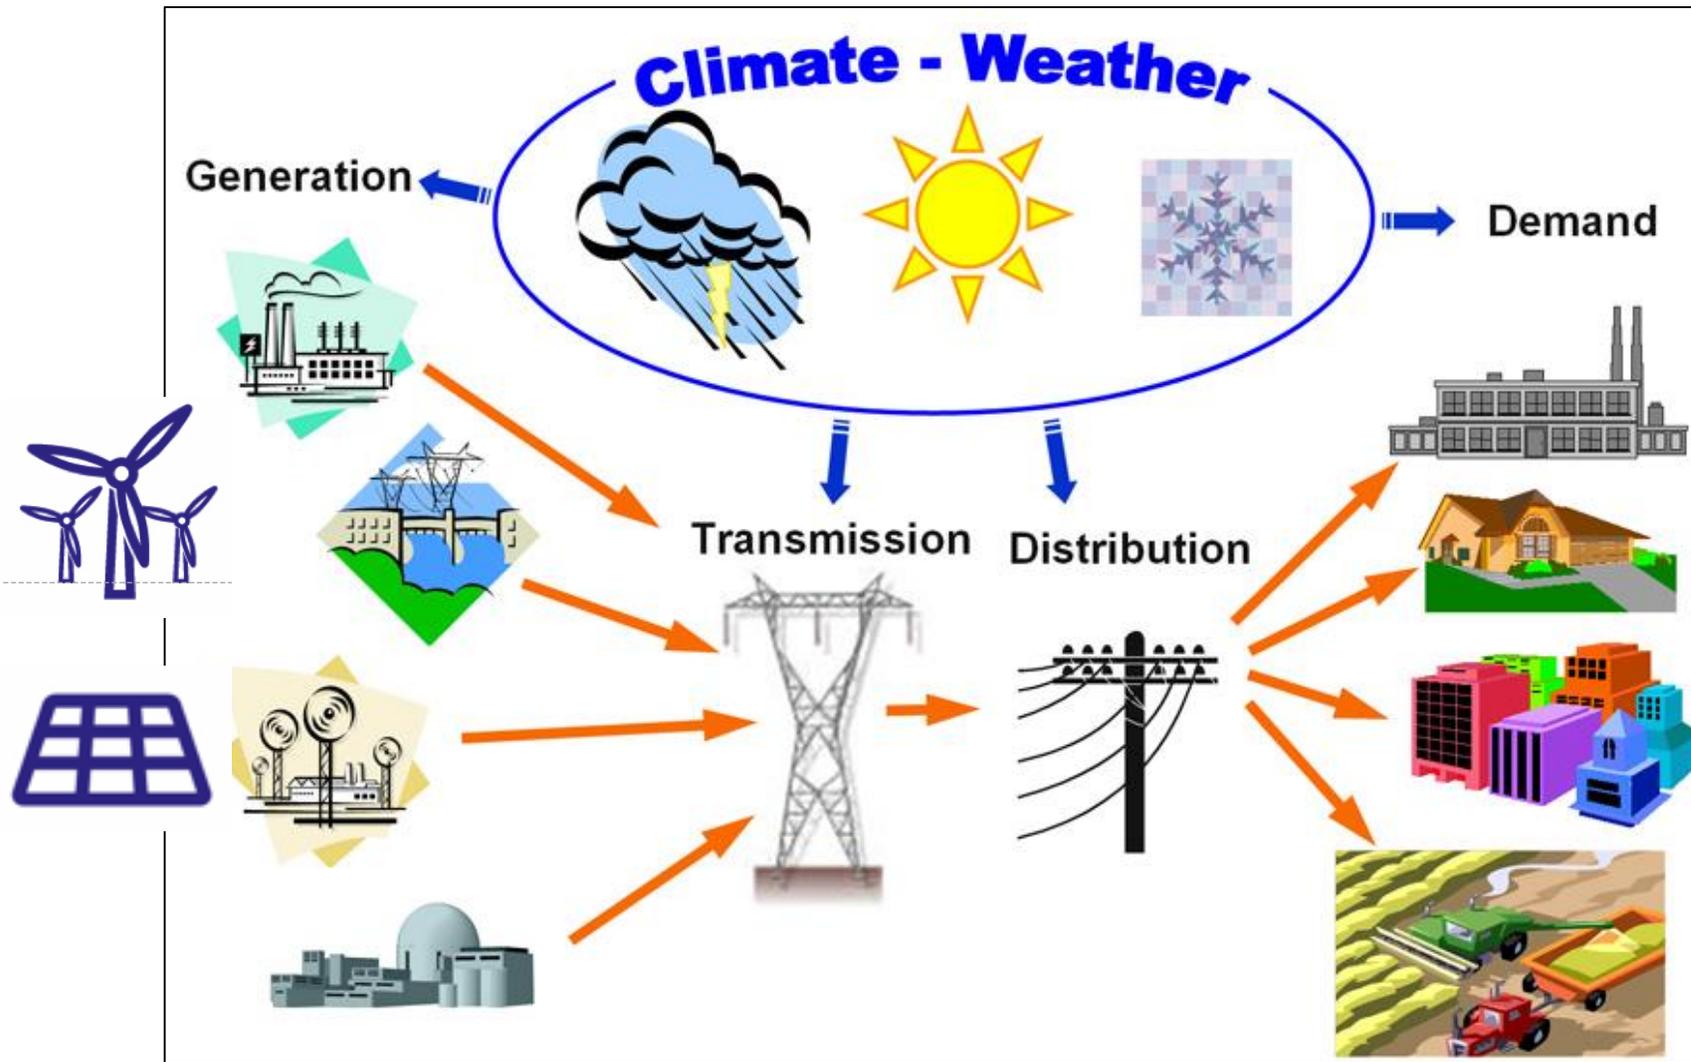

20.4

- End of 2018, the total installed capacity was:
  - **Wind power:** 15.1 GW (Objective 2023: 27 GW, incl. 2.4 Offshore)
  - **Solar power:** 8.5 GW (Objective 2023: 20.6 GW, 30 GW in 2035)
  - **Nuclear:** 63,3 GW
  - **Hydro:** 22,8 GW

# Weather & Climate impacts

At all time scales!

# Economic and technical assessment of a 60% RE EU system

GEOGRAPHICAL DIVERSITY DOES HELP, BUT THERE IS STILL SIGNIFICANT VARIABILITY AT EUROPEAN LEVEL

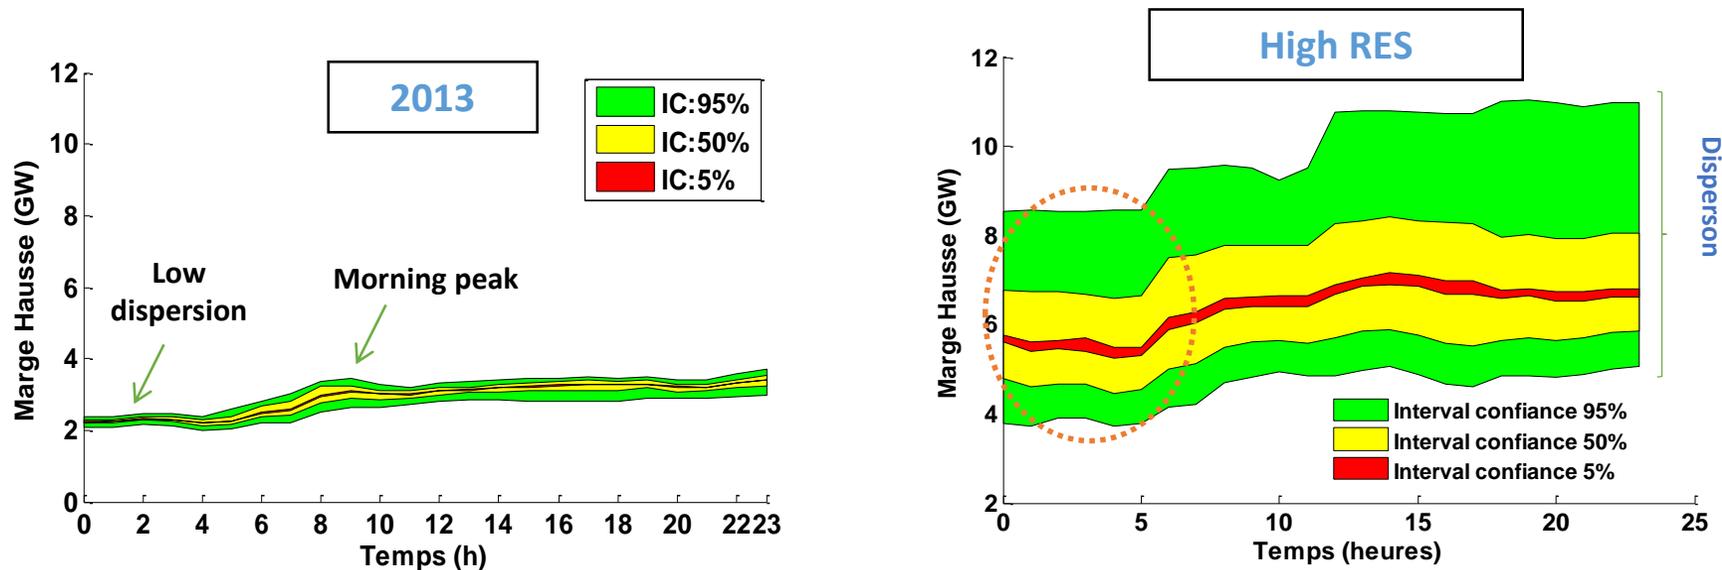

You can reduce the variability of wind and PV at local level but the correlation in weather regimes acts as a limit at continental level

# Economic and technical assessment of a 60% RE EU system

## FLEXIBILITY MARGINS NEED TO INCREASE DUE TO VARIABLE GENERATION (AND ASSOCIATED FORECAST ERRORS)

Profile of day-ahead upward operation margin required to cover a 1% risk level

The operation margin profile changes and in the future critical periods are no longer driven by demand patterns => need for dynamic calculation of flexibility margins and reserve requirements

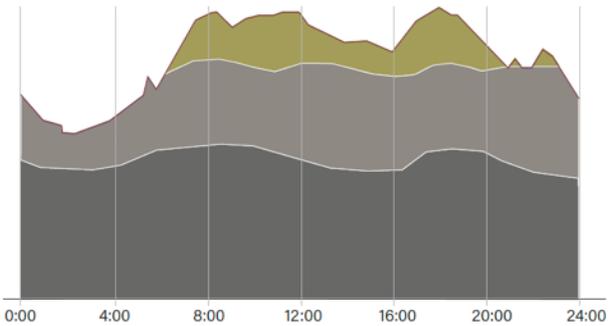

➔ For large penetration of wind and PV generation:

- variability and uncertainty have a significant impact
- short term operation needs to be considered at planning stage

# New Energy paradigms are necessary

Figure 59. Conceptual Progression from the Baseload Paradigm to a New Paradigm of 100% Renewable Electricity

## A) The Baseload Paradigm

	Power generation	
Peak		
Intermediate and dispatchable		
Baseload		

**Improved Forecasts  
&  
New Forecasts  
are necessary**

In the early stages of progression to larger shares of variable renewable generation, power systems make some adjustments in their grid operations, develop forecasting systems for renewable energy production, and introduce improved control technology and operating procedures for efficient scheduling and dispatch.

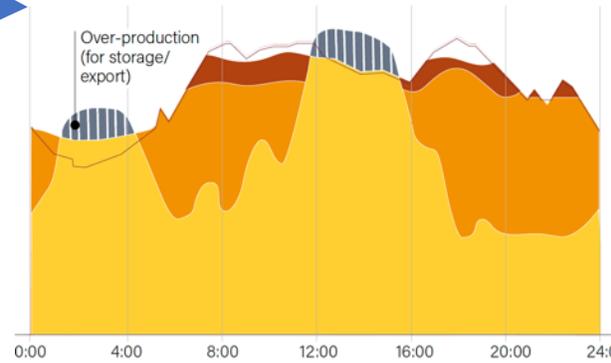

## B) The Early Transition

	Power generation	
Demand shift	→ to early morning lows	
Peak		
Intermediate and dispatchable		
Baseload		
Variable renewable energy		

In the late stages of progression towards fully renewable power systems, variable renewable power will be integrated through advanced resource forecasting, grid reinforcements and strengthened interconnections, improved information and control technologies for grid operations, widespread deployment of storage technologies, greater efficiency and scope of demand response, and coupling of electricity, heating and cooling, and transport sectors.

## C) A New Paradigm

	Power generation	
Over-production		→ for storage or trade
Storage or import/trade		from solar and wind peaks
Dispatchable		
Variable renewable energy		

\* CSP with thermal energy storage

# EDF and subsidiaries: Many space & time scales

	EDF France	EDF Purchase Obligations	EDF Agregio	ENEDIS DSO	EDF Overseas	EDF Renewables
Spatial scale(s)	France	France	France (subset of Wind & Solar farms)	France + Local	Territory (Islands + French Guiana)	Individual Farms
Main Variables	<b>Load, Hydro, Wind, Solar, Thermal</b>	<b>Wind, Solar</b>	<b>Wind, Solar</b>	<b>Load, Wind, Solar</b>	<b>Load, Hydro, Wind, Solar</b>	<b>Wind, Solar</b>
Time scale(s)	RT to ~5-10 years	Day-Ahead + Intra-Day	Day-Ahead + Intra-Day	Day-Ahead + Intra-Day + up to 1-3 years	RT to Day-Ahead	Intra-Day Day ahead...
Target	Supply/demand Balance	Market	Market	Distribution System Management	Distribution System Management	Monitoring, performance, market operations
Available data	Public (regional + national)	Individual farms (not in RT)	Individual farms (not in RT)	Wind power: 10' measurements at every farm (not RT) Solar power: 10' measurements for <50 % (in capacity) (not RT)	RT aggregated data	Individual farms

# Weather, Climate and Renewables Forecasting Group activities

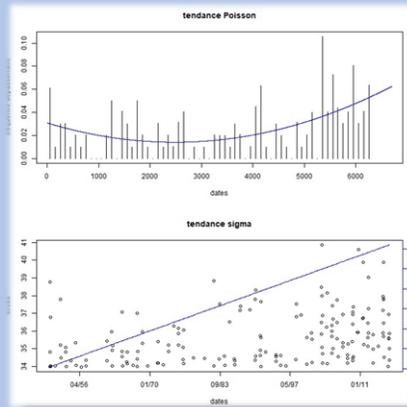

**Renewables  
Forecasts  
(Solar PV & Wind  
+input data for  
hydrological  
modelling)**

**Long-range forecasts  
(monthly to seasonal),  
Climate Change impacts &  
Climate Services**

**Natural Hazards

Patent

Deterministic  
& probabilistic  
forecasts

Mainly ECMWF & Météo-France

# Solar Forecasts – Real-time visualization tool

# Solar Forecasts: performance

## MAPE at Aggregated Scale (continental France)

Solar Power	D	D+1	D+2	D+3	Climatology
% of installed capacity	3,6	4	4,6	5,1	9,4
MW for PI= 7 GW	250	280	320	360	660

Maximum of the Mean Absolute Error (in the middle of the day)

### At local scale :

- Error 2 or 3 times greater than at country scale

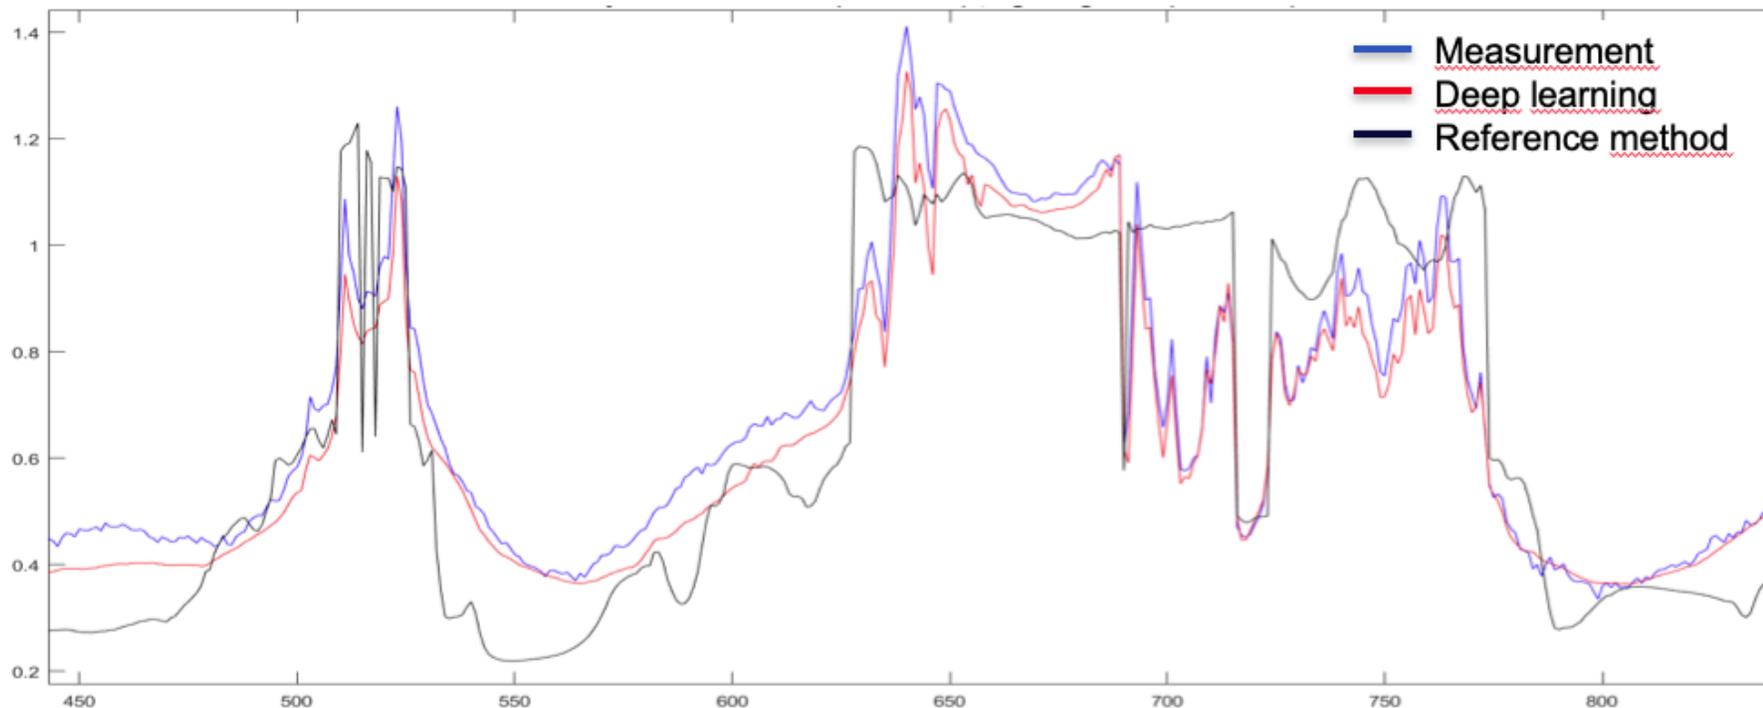

EDF R&D winner of  
the benchmark  
COST WIRE 2012  
(local forecasts)

# Recent results with ground cameras

These results may enable to use ground cameras as pyranometers

Method	RMSE	nRMSE
Reference	0.146	21.6%
Deep Learning	0.033	4.8%

GHI estimation error over one year

Real time estimation of GHI with ground images (10 sec. step)

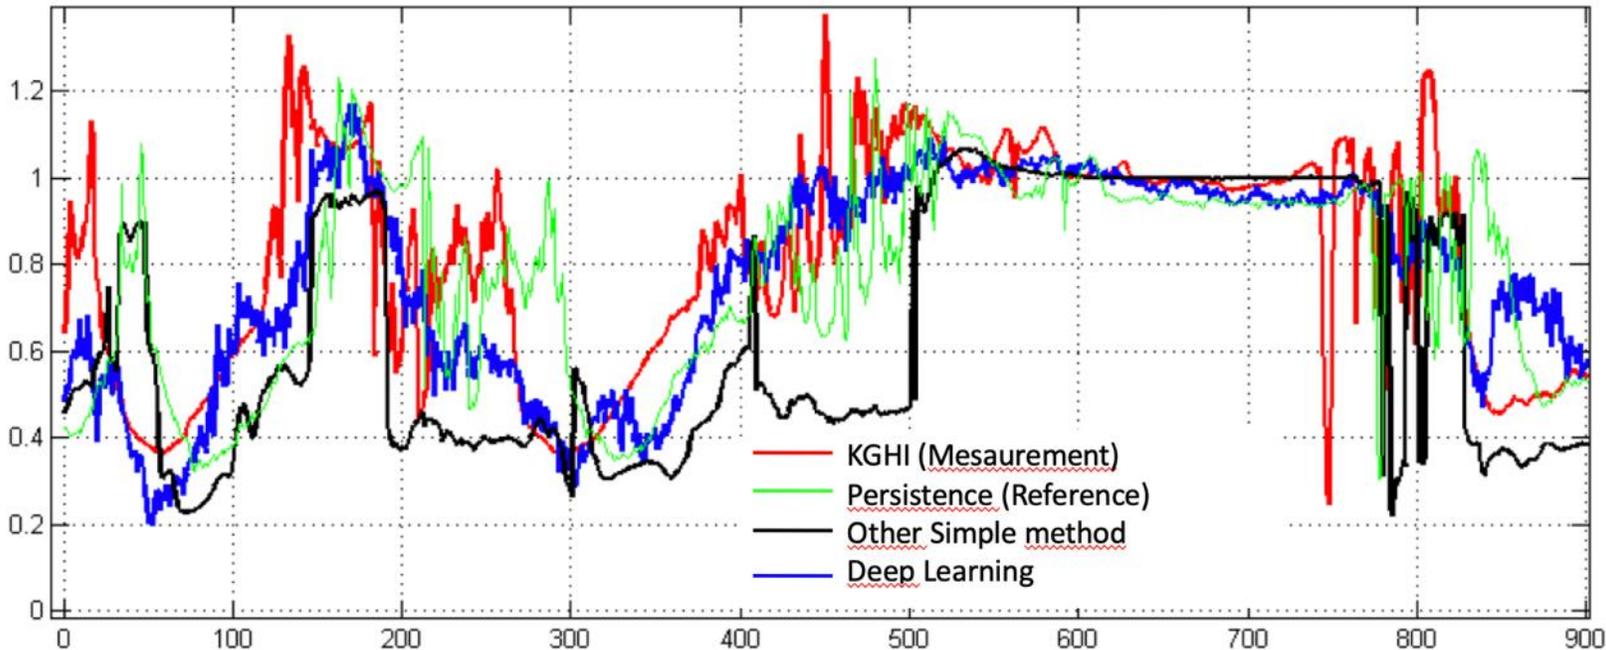

# First forecasting results with ground cameras

Patent

First results that will be improved.  
The 10 sec time step is very difficult to forecast accurately, a lower frequency gives better results.

Method	RMSE	nRMSE
Persistence	0.198	28.5%
Deep Learning	0.168	24.8%

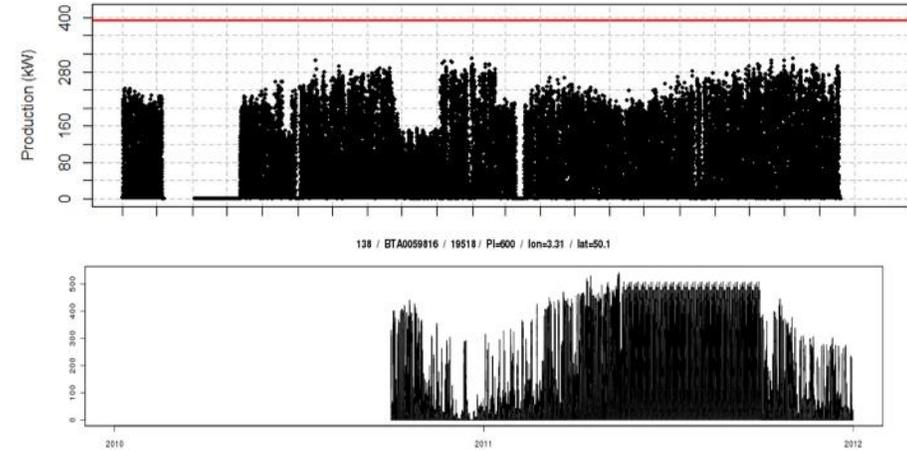

10 sec GHI forecast (horizon 5 min) error over 4 days

# Some Challenges

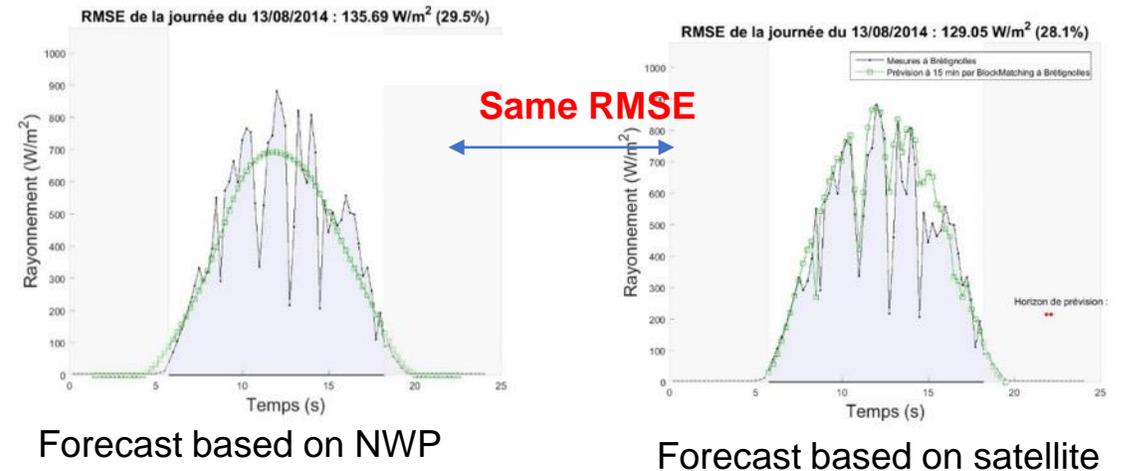

## Quality of input data

- Robustness (real time)
- Reliability (real time)

## Quality of NWP models

- Spatial and temporal resolution
- Difficulty in evaluating the contribution of higher resolution models (metrics, availability / relevance of observations)

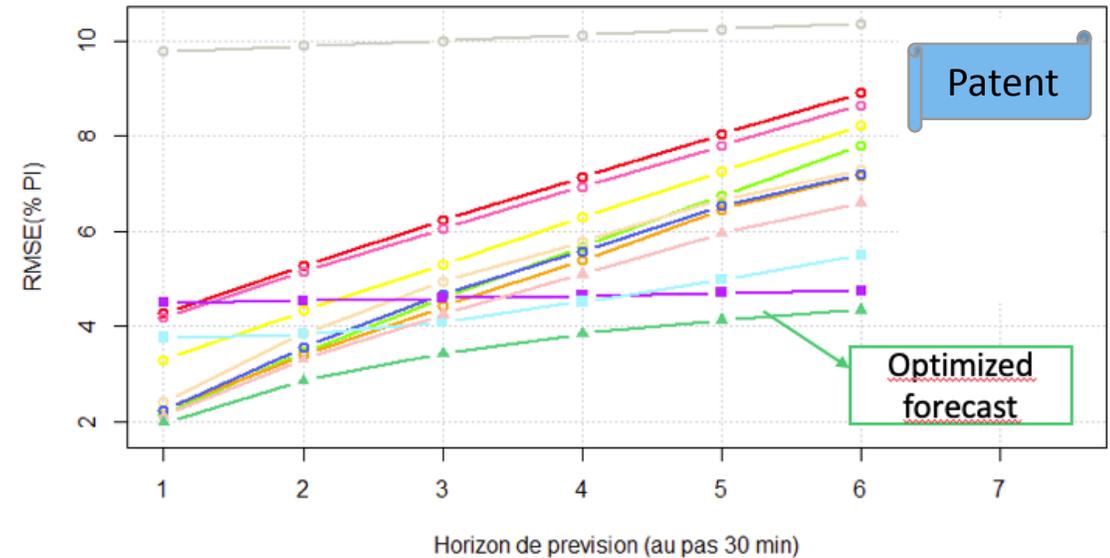

# Next steps

## ■ Enhancement of the forecast accuracy at local scale, through:

- Models' enhancement (NWP, satellites, ground images, real time production - based)
- new input data (higher resolution, better quality,...)
- blending of a large number of forecasts as input data for smart optimization

## ■ Probabilistic forecasts

- still not used in operations
- WIP

Error vs forecast horizon of different forecasts

## Summary

- ✓ **Energy transition ~ Low Carbon Electricity Generation**
  - ✓ **Further increase of power systems' dependence on meteorology**
  - ✓ **Space & time scales are interdependant**
- Need improved information, data & forecasts at all space & time scales  
(not only for short-term RE integration)**

More than ever, we need to  
**further develop collaboration**  
between the energy industry  
and the weather & climate community

## WEMC DATA SPECIAL INTEREST GROUP

This webinar is part of the World Energy and Meteorology Council (WEMC) Special Interest Group on Data exchange, access and standards.

Using and exchanging data is critical to improving renewables forecasts and their integration into the grid. However, many specialists agree that data format, standard and access limits the development of tools and activities. This webinar looks at why data sharing is important to improve renewable energy forecasts, how data exchange is organized in meteorology and how data can help the energy industry progress faster in integrating more renewable energy into the grid.

[REGISTER HERE](#)

After registering, you will receive a confirmation email containing information about joining the webinar. [View system requirements](#)

For further information, talk abstract and biography, please visit [www.wemcouncil.org](http://www.wemcouncil.org). A recording will be available after the webinar.

## MEET THE EXPERTS

INTRODUCTION: WHO ARE WEMC? WHAT IS THE DATA SIG AND IT'S OBJECTIVES?
