

Power Flow Control as an Accelerator for Renewable Integration

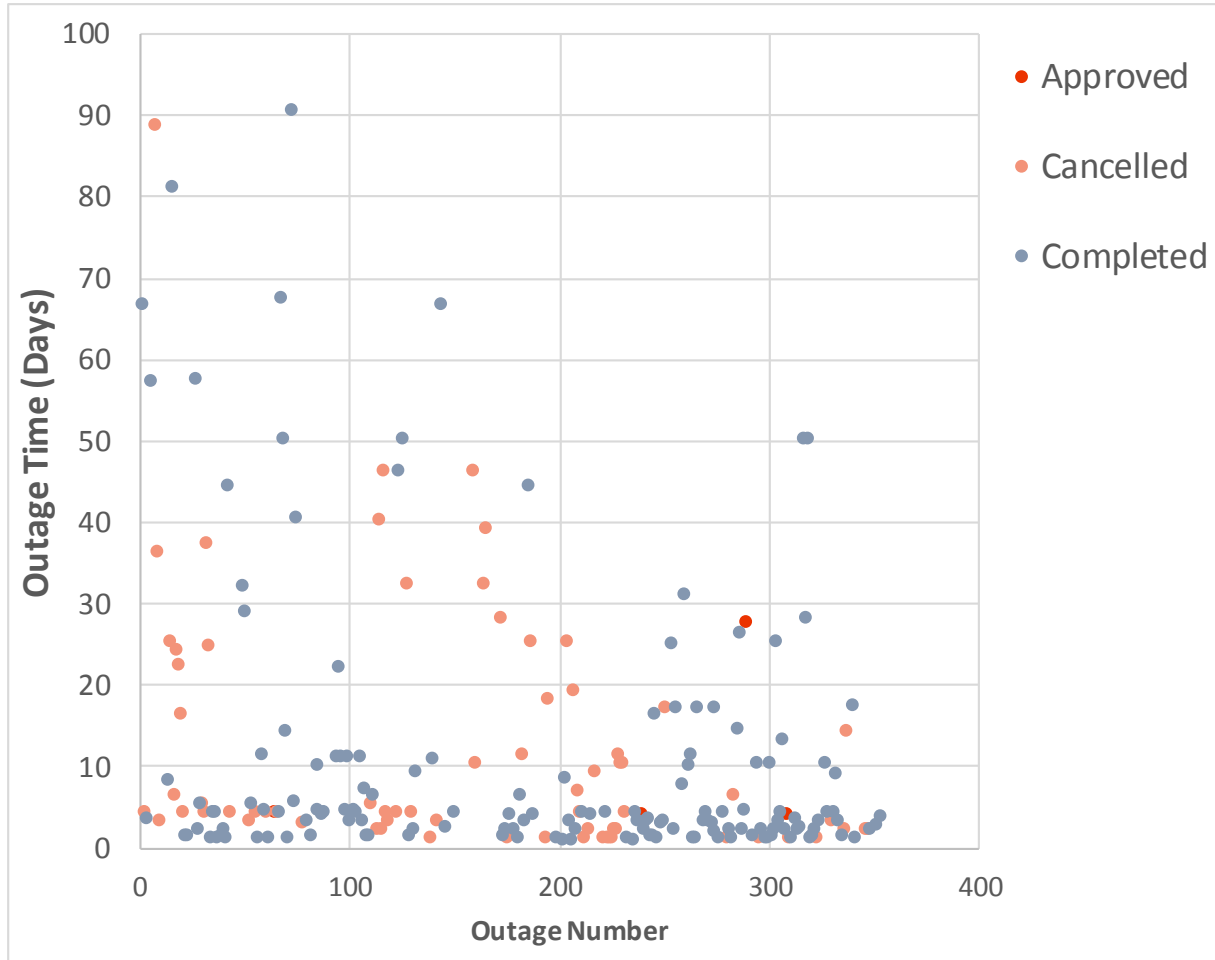

Frank Kreikebaum
SVP of Products and Solutions

Modular Power Flow Control (PFC) Users

Difficulty Scheduling Transmission Outages – BC Hydro Example

13,000 line-miles of transmission

360

OUTAGES OVER 1 DAY

70

OUTAGES CANCELED

10

OUTAGES DENIED

Congestion is Costly and Slowing Renewable Development

>\$3B ANNUAL COST OF CONGESTION IN US ISO/RTOs

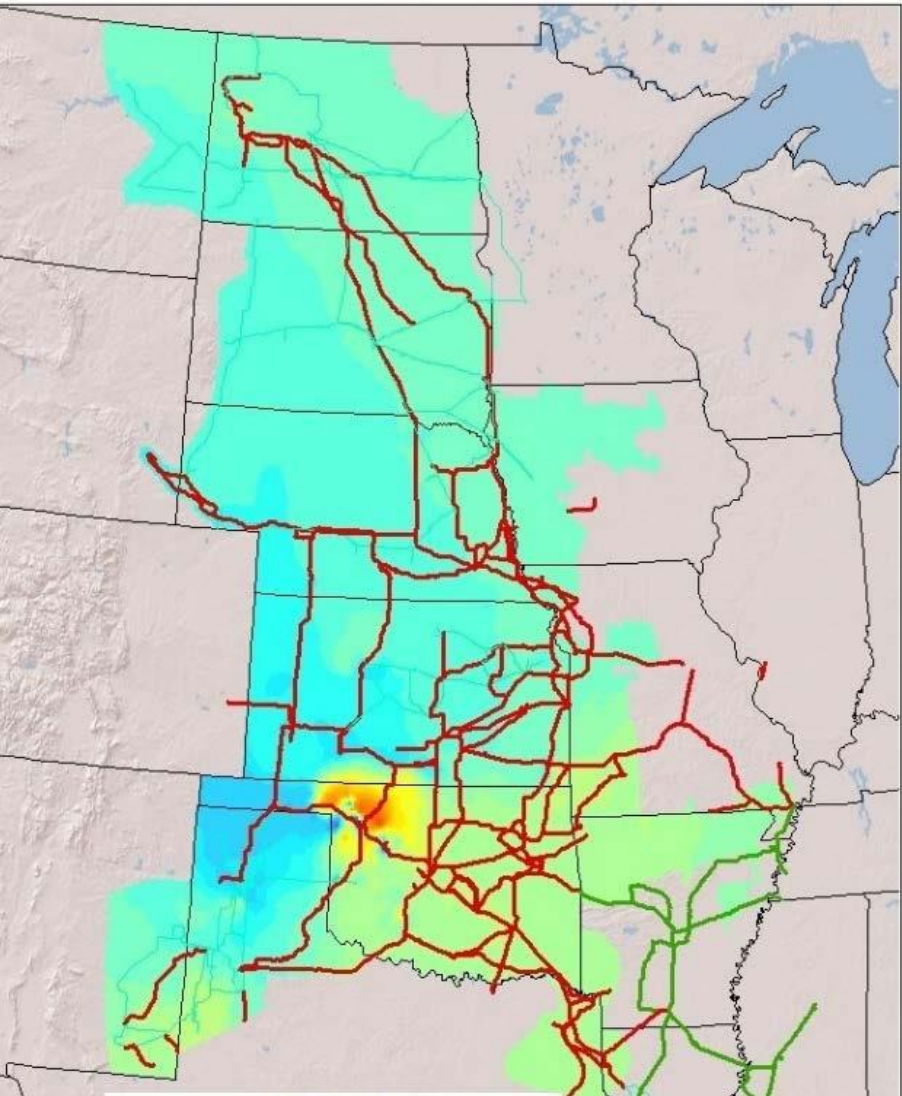

>25% CONGESTION CAUSED BY TRANSMISSION OUTAGES IN US ISO/RTOs

10 AVERAGE NUMBER OF YEARS REQUIRED TO DESIGN, PERMIT AND BUILD A NEW TRANSMISSION LINE

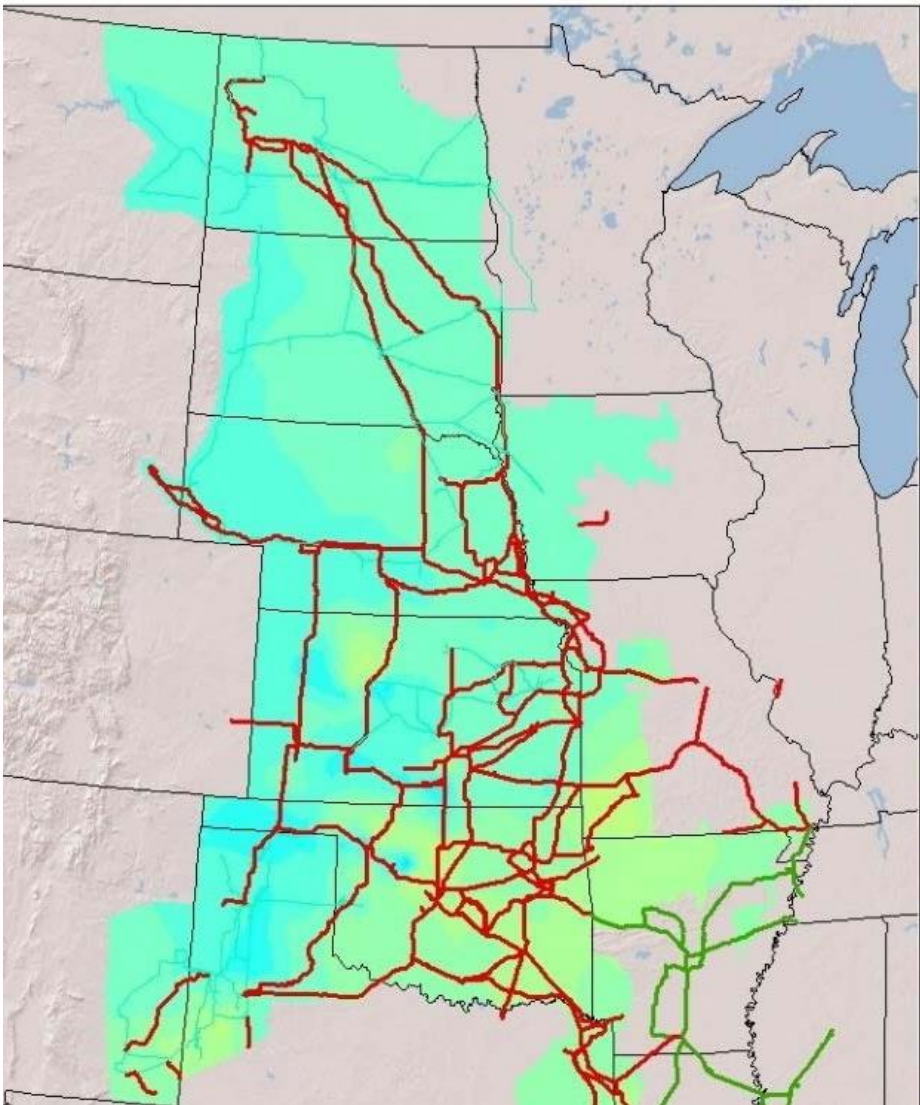

2 AVERAGE NUMBER OF YEARS REQUIRED TO DESIGN, PERMIT AND BUILD A UTILITY-SCALE RENEWABLE PLANT

Example of PFC Impact on Congestion

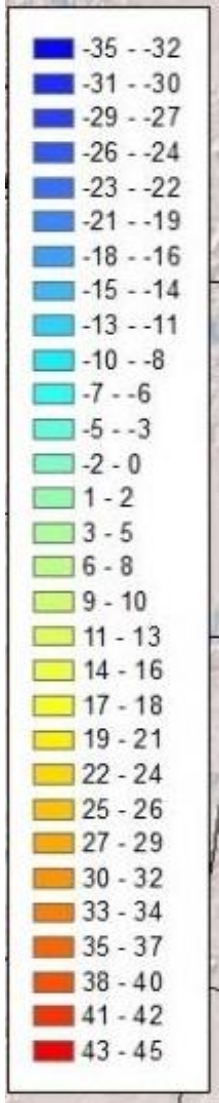

W

Before Woodward PST Installation

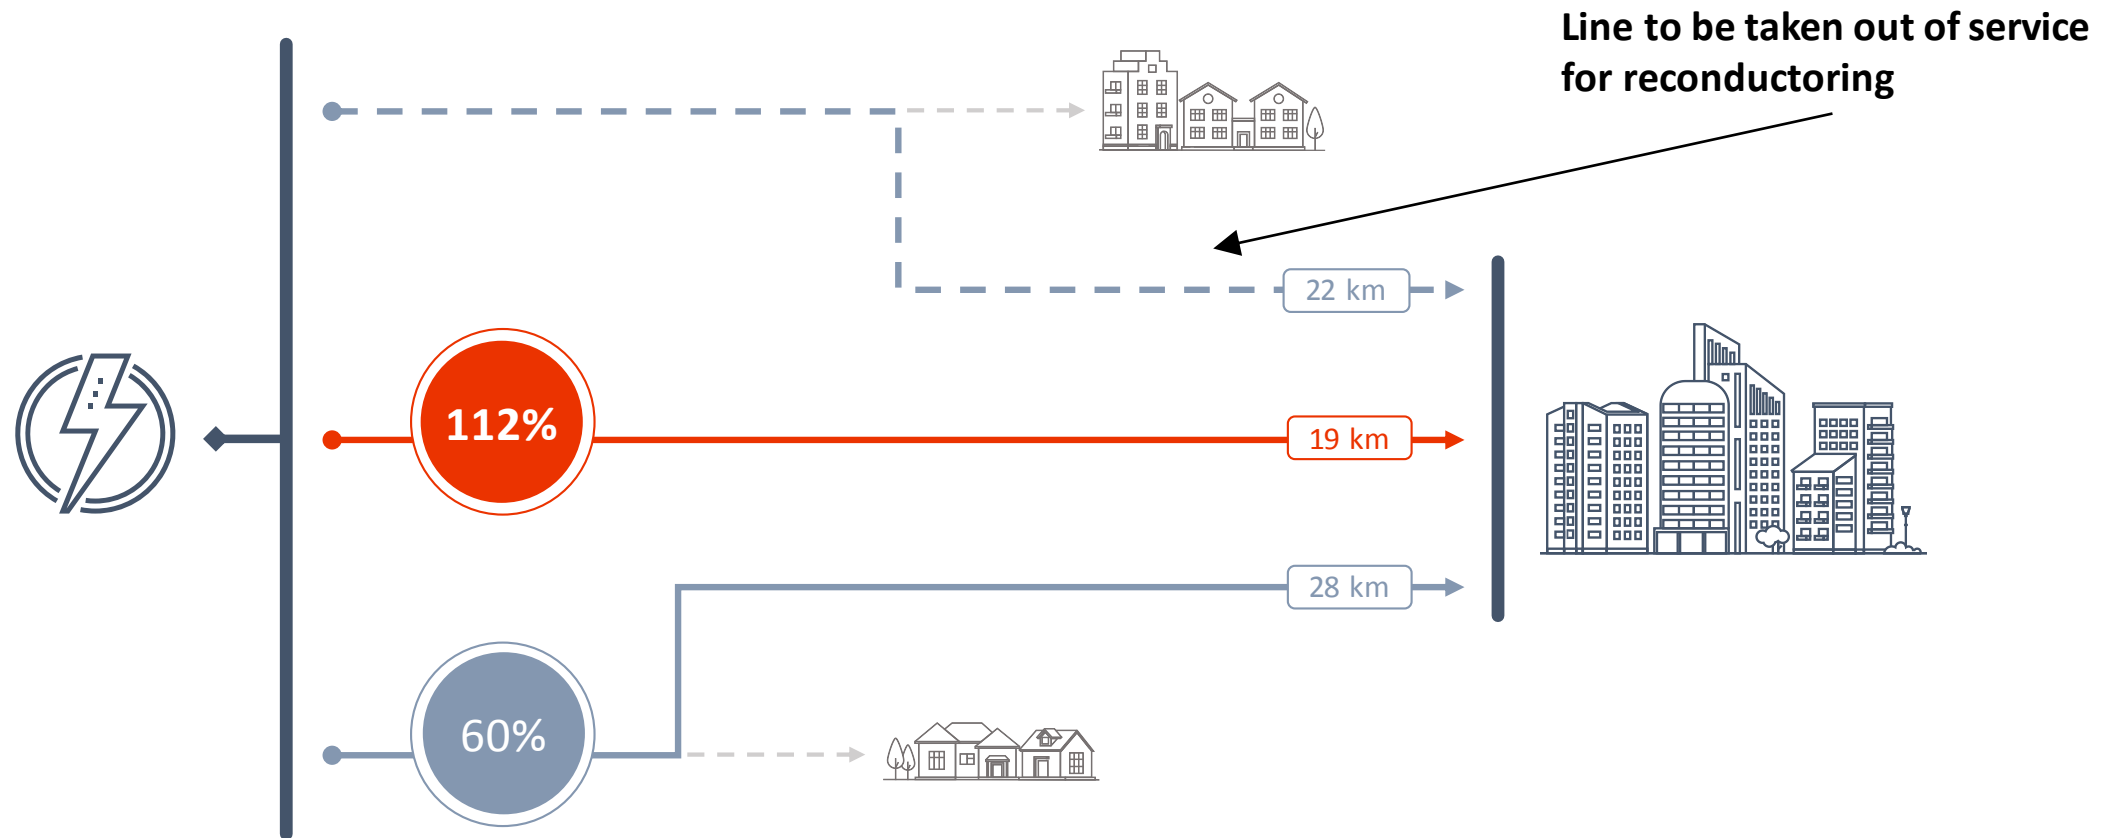

After Woodward PST Installation

REIMAGINE THE GRID

Facilitating Transmission Construction with Mobile PFC Solutions

Facilitating Transmission Construction with Mobile PFC Solutions

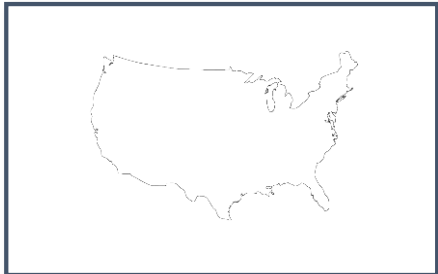

Examples of PFC Impact on Outage Scheduling

Europe

- A large European TSO identified 16 construction projects that were infeasible due to outage concerns
- Deploying 5 Mobile PFC trailers enables 14 of these 16 outages to be feasible

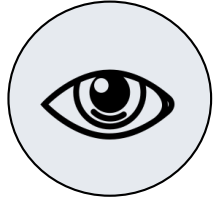

United States

- A top-10 TO studied 6 maintenance and construction projects that were infeasible
- 5 of the 6 projects were feasible with no more than 2 Mobile PFC trailers per site

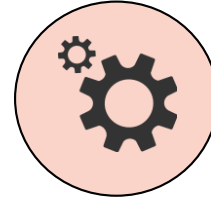

**CHALLENGES
AHEAD**

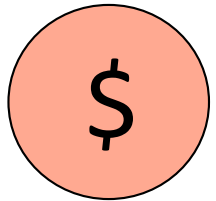

Challenges to Full Integration of PFC into Operations

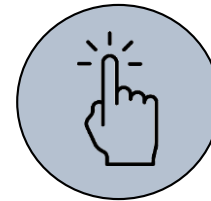

Integration of PFC into situational awareness tools

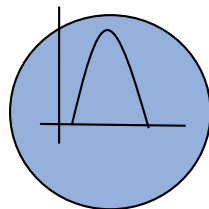

Embedding PFCs into the core EMS/MMS functions

Ensuring market participants have visibility to how PFCs will be dispatched

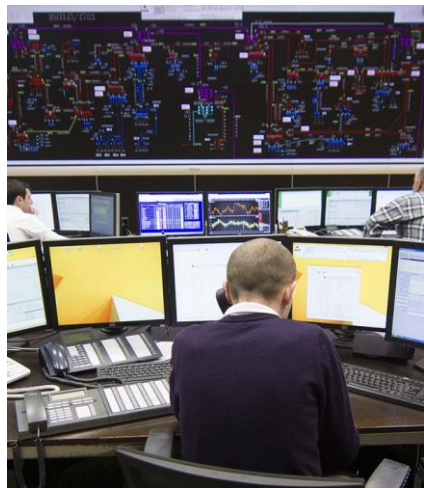

Developing best practices for the proper mix of control modes - operator controlled, centrally controlled automatically, locally controlled automatically

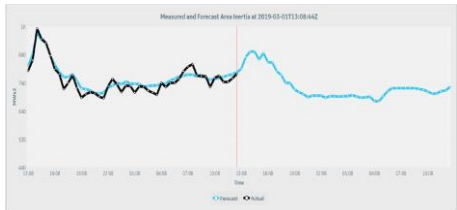

Accounting for the impact of devices on limits that are exogenous to the tools (e.g. stability limits in SCUC)

Advancements in Ops Automation

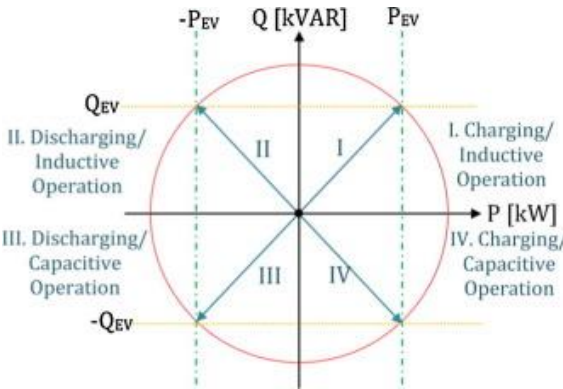

Staffed
substations
directed by
centralized
operators

Automated Volt-VAR
dispatch

Centralized
control via EMS
