

Lessons Learned from 25 Years of International Renewables Integration Consulting

Dr. Dipl.-Ing. Thomas Ackermann
Energynautics GmbH
t.ackermann@energynautics.com

Biography Thomas Ackermann

➤ **Diplom Wirtschaftsingenieur**

- (MSc in ME and MBA) – Technical University, Berlin, Germany

➤ **MSc in Physics**

- Otago University, Duniden, New Zealand

➤ **Ph.D. Electrical Engineering (Power System Deregulation and Distributed Generation)**

- Royal Institute of Technology, Stockholm, Sweden

➤ **Founder and CEO of Energynautics, a German-based research and consulting company in the field of renewable generation and power systems;**

➤ **Consultant for Renewable & Grid Integration for the past 25 years/worked in 33 countries**

- Abu Dhabi, Australia, Bahamas, Bangladesh, Barbados, China, Costa Rica, Denmark, Estonia, Ghana, Galapagos, Germany, Guatemala, Guyana, Honduras, India, Indonesia, Japan, Jordan, Kenya, Sweden, Mongolia, New Zealand, Norway, Oman, Philippines, Seychelles, Thailand, Tonga, Trinidad und Tobago, Turkey, Vietnam and USA

➤ **Lecturer Royal Institute of Technology, Stockholm, Sweden (and Hector Business School, Karlsruhe)**

➤ **Fulbright Schuman Scholar (2023) - Visiting researcher at the Hawai'i Natural Energy Institute of the University of Hawai'i at Mānoa (UHM) in Honolulu, Hawaii.**

Energynautics based in Damstadt/Germany

Research and Consulting company
the area of grid integration of
renewables

Started April 2000

Services by energynautics

Recent German Aspects

European Energy Crisis: Have Renewables Failed?

energynautics
solutions for sustainable development

... or at least that's what half the world seems to believe these days.

It's obviously not true, but that needs to be communicated more aggressively.

- RE stabilize prices and provide energy without reliance on fossil fuel imports.
- The crisis is multifactorial and a continuing reliance on large scale thermal generation is among the root causes:
 - French nuclear issues (up to 32 GW offline)
 - Shortage of gas
 - High gas and coal prices
 - Too little hydro availability

Germany is Bringing Back Coal...

energynautics
solutions for sustainable development

... or is it?

- A few mothballed coal units are being brought back online
- Temporary short-term measure in an acute Europe wide energy crisis
- No plans (so far...) to go back to coal in the long run
- No new investments in coal planned
- Misleading headlines are great ammunition for anti-RE propagandists... again, undermining worldwide decarbonization efforts

IRENA Report

energynautics
solutions for sustainable development

2016

2022

Hosting Capacity Study New Delhi and Bhopal

GOAL

- Study on the integration of roof-mounted PV into Indian distribution grids

TASKS

- Analysis of the legal and regulatory frameworks in India as well as more detailed technical and regulatory studies for two distribution grid areas
- Scenario development for PV distribution
- Distribution grid modelling, load flow calculations, storage optimization
- Studies on power quality and voltage control
- Organization of capacity building workshops for the operators

Rio de Janeiro (1992) to Sharm El-Sheikh, Egypt (2022)

The establishment of the United Nations Framework Convention on Climate Change (UNFCCC) in 1992, and the simultaneous UN Earth Summit in Rio de Janeiro, generated the international efforts to tackle climatic change. Over the years, the UNFCCC-Conference of the Parties (COP) has led the efforts in climate change mitigation and adaptation, with many sequential meetings across the world.

Three decades later, at the COP27 meeting in Sharm El-Sheikh, Egypt, it is evident that climate change impacts have substantially worsened.

(Experience Bad projects: Road Map project stopped)

Lessons learned - > Regulations are super important

System transformation requires holistic approach

Policies, markets and regulatory frameworks link technical, economic and institutional aspects

Relevance of Regulations

Kirchhoff's laws

Kirchhoff's Law #1: Current

- The current entering any junction is equal to the current leaving that junction.

Kirchhoff's Law #2: Voltage

- The sum of all the voltages around a loop is equal to zero.

In the current power system landscape, Gustav Kirchhoff may as well have formulated a third law:

Kirchhoff's Law #3: Regulation

- No currents or voltages can do anything useful **if the regulatory framework** isn't right!

Relevance of Regulations and Utility Financing

Kirchhoff's laws

Kirchhoff's Law #1: Current

- The current entering any junction is equal to the current leaving that junction.

Kirchhoff's Law #2: Voltage

- The sum of all the voltages around a loop is equal to zero.

In the current power system landscape, Gustav Kirchhoff may as well have formulated a third law:

Kirchhoff's Law #3: Regulation/ Utility Financing

- No currents or voltages can do anything useful if the regulatory and utility financing framework isn't right!

(Example: Rates in Africa /demand drop due to Corona)

Tariff Cost Recovery Ratio versus Quality of Supply (2015)

Structure prevalent in developing countries: Tariffs increase with consumption

Basic Idea:

- Large (wealthy, commercial) consumers subsidize small (poor, residential) consumers;

Issues with the introduction of net-metering:

- Large (wealthy) consumers invest into rooftop PV systems; this way they reduce their consumption and drop to a lower tariff;
- Less consumers are available to subsidize small consumers
- Utility cannot recover its costs anymore!
- Utilities are fully or partly government owned, so they will not complain directly about the introduction of renewables, but:
- Utilities start to mention „technical issues“... „grid limits“ „grid instability due to renewables“

EU Green Washing difficult to explain ...

The EU recently labeled investments in gas fired and nuclear generation as “sustainable”

- This decision is controversial
- “Sustainable” is not the same as “renewable” or “climate neutral”
- Labeling fossil gas as “renewable”, “green” or anything in that direction potentially undermines the worldwide energy transition and decarbonization efforts

Lessons learned - >The real issues are often much more complicated

In many Countries the Power Industry is still a Monopoly!

The Process of Unbundling is often
Happening parallel with VRE
Introduction -> Renewable Auctions

Unbundling and Regulation of Generation, Transmission & Distribution

Overview Renewable Auction Results

But grid integration is not about renewable energy costs anymore

Paradigma of international development activities

Step 1: Country should formulate what they need!

Step 2: International funding agencies provide funding - > international consultants are asked to do the study/with stakeholder involvement

Step 3: Strategie/training should ensure that next version of roadmap/relevant problems can be solved by local experts in the future

Typical Solution: Roadmap

Problem 1: Data collection, often perceived as control!, sometimes bribes expected..

Problem 2: Budget

Problem: Trained local experts leave for better paid jobs

Denmark – Grid Upgrades between 2010-2020

Extra >600 MW HVDC connection to Norway in 2010

Upgrade of HVDC line to Sweden to 740 MW (plus 200 MW)

New 600 MW HVDC connection over The Great Belt by spring 2010

New Connection to Netherlands (700 MW)

New 400 MW to Germany (offshore)

Capacity Doubled to Germany (onshore)

Overview

African Union has launched the [Africa Single Electricity Market \(AfSEM\)](#) on 3rd June 2021. Implementation of AfSEM will be supporting the Continental Power System Masterplan (CMP) currently being developed by the African Union Development Agency (AUDA-NEPAD). Together with the IAEA, IRENA is supporting the CMP initiative as officially endorsed modelling partner ([IRENA press release](#)).

IRENA's CMP support is a multi-year programme under the aim to establish a long-term continent-wide planning process for power

Burkina Faso

- Low income country with GDP (2019) \$14.13 billion;
- Population in 2019 was 20.32 Million, estimated to reach 45 Million in 2050;
- Electrification rate: 20% with 66% of the urban and 3% of the rural population;
- Officially installed capacity around 550 MW, Cost of production at \$0.22-0.25 USD/kWh
- Around 37% of the electricity is imported from neighbouring Ivory Coast. New transmission interconnections are also near completion to import electricity from Ghana

2017 Electricity Generation Mix: 1741 GWh

2030 (a) Electricity Generation Mix: 8830 GWh

2050 Electricity generation mix: 345000 GWh

27 GW by 2050

Ideas towards a solutions?

Not purchase of grid systems/Colonialism (Germany)

Renewable IPPs help to reduce the complexity for TSOs/DSOs (I)

- Virtual Power Plants (Germany has around 40 GW)

Combination of a large quantity of small distributed energy resources and demand response

All connected to the same grid

Controlled via a communication system

Benefits:

- Flexibility - If primary resource is not available, another type of generation can assist
- Higher reliability due to distributed risk
- Added value through controlling previously uncontrolled resources

Requires:

- (Complex) Optimization
- Secure Communication

Problem: No Markets/What incentives are needed – Task for G-PST?

M. Shabanzadeh et al. / Applied Energy 200 (2017) 273–289

Fig. 1. A vision for VPP as an aggregator of heterogeneous DERs.

Renewable IPPs help to reduce the complexity for TSOs/DSOs (II)

- Hybrid Power Systems with BESS/4 hours storage (Hawaii)

PPAs

Renewable IPPs help to reduce the complexity for TSOs/DSOs (III)

- Local Energy Management Systems for distribute generation
